# 1. Introduction

This document provides the software interface to the *ccurpmfc* driver which communicates with the Concurrent Real-Time PCI Express Programmable Multi-Function FPGA I/O Card (MIOC). For additional information for low-level programming is contained in the *Concurrent Real-Time PCIe Programmable Multi-Function I/O Cards (MIOC) Design Specification* (No. 0610104) document.

The software package that accompanies this board provides the ability for advanced users to communicate directly with the board via the driver *ioctl(2)* and *mmap(2)* system calls. When programming in this mode, the user needs to be intimately familiar with both the hardware and the register programming interface to the board. Failure to adhere to correct programming will result in unpredictable behavior.

Additionally, the software package is accompanied with an extensive set of application programming interface (API) calls that allow the user to access all capabilities of the board. The API library also allows the user the ability to communicate directly with the board through the *ioctl(2)* and *mmap(2)* system calls. In this case, there is a risk of this direct access conflicting with API calls and therefore should only be used by advanced users who are intimately familiar with the hardware, board registers and the driver code.

Various example tests have been provided in the *test* and *test/lib* directories to assist the user in developing their applications.

## 2. Software Support

Software support is provided for users to communicate directly with the board using the kernel system calls (*Direct Driver Access*) or the supplied *API*. Both approaches are identified below to assist the user in software development.

### 2.1 Direct Driver Access

#### 2.1.1 *open(2)* system call

In order to access the board, the user first needs to open the device using the standard system call *open(2)*.

```
int fp;  
fp = open("/dev/ccurpmfc0", O_RDWR);
```

The file pointer '*fp*' is then used as an argument to other system calls. The user can also supply the *O\_NONBLOCK* flag if the user does not wish to block waiting for reads to complete. In that case, if the read is not satisfied, the call will fail. The device name specified is of the format *"/dev/ccurpmfc<num>"* where *num* is a digit 0..9 which represents the board number that is to be accessed. Basically, the driver only allows one application to open a board at a time. The reason for this is that the application can have full access to the card, even at the board and API level. If another application were to communicate with the same card concurrently, the results would be unpredictable unless proper synchronization between applications is performed external to the driver API.

This driver allows multiple applications to open the same board by specifying an additional *oflag* *O\_APPEND*. It is then the responsibility of the user to ensure that the various applications communicating with the same cards are properly synchronized. Various tests supplied in this package has the *O\_APPEND* flags enabled, however, it is strongly recommended that only one application be run with a single card at a time, unless the user is well aware of how the applications are going to interact with each other and accept any unpredictable results.

### 2.1.2 *ioctl(2)* system call

This system call provides the ability to control and get responses from the board. The nature of the control/response will depend on the specific *ioctl* command.

```
int    status;
int    arg;
status = ioctl(fp, <IOCTL_COMMAND>, &arg);
```

where, '*fp*' is the file pointer that is returned from the *open(2)* system call. *<IOCTL\_COMMAND>* is one of the *ioctl* commands below and *arg* is a pointer to an argument that could be anything and is dependent on the command being invoked. If no argument is required for a specific command, then set to *NULL*.

Driver IOCTL command:

```
IOCTL_CCURPMFC_ABORT_DMA

IOCTL_CCURPMFC_WAIT_FOR_DIO_COS_INTERRUPT
```

**IOCTL\_CCURPMFC\_ABORT\_DMA:** This *ioctl* does not have any arguments. Its purpose is to abort any DMA already in progress..

**IOCTL\_CCURPMFC\_ADD\_IRQ:** This *ioctl* does not have any arguments. Its purpose is to setup the driver *interrupt handler* to handle interrupts. If support for MSI interrupts are configured, they will be enabled. Normally, there is no need to call this *ioctl* as the interrupt handler is already added when the driver is loaded. This *ioctl* should only be invoked if the user has issued the *IOCTL\_CCURPMFC\_REMOVE\_IRQ* call earlier to remove the interrupt handler.

**IOCTL\_CCURPMFC\_DISABLE\_PCI\_INTERRUPTS:** This *ioctl* does not have any arguments. Its purpose is to disable PCI interrupts. This call shouldn't be used during normal reads or writes, as calls could time out. The driver handles enabling and disabling interrupts during its normal course of operation.

**IOCTL\_CCURPMFC\_ENABLE\_PCI\_INTERRUPTS:** This *ioctl* does not have any arguments. Its purpose is to enable PCI interrupts. This call shouldn't be used during normal reads or writes as calls could time out. The driver handles enabling and disabling interrupts during its normal course of operation.

**IOCTL\_CCURPMFC\_GET\_DRIVER\_ERROR:** The argument supplied to this *ioctl* is a pointer to the *ccurpmfc\_user\_error\_t* structure. Information on the structure is located in the *ccurpmfc\_user.h* include file. The error returned is the last reported error by the driver. If the argument pointer is *NULL*, the current error is reset to *CCURPMFC\_SUCCESS*.

**IOCTL\_CCURPMFC\_GET\_DRIVER\_INFO:** The argument supplied to this *ioctl* is a pointer to the *ccurpmfc\_driver\_info\_t* structure. Information on the structure is located in the *ccurpmfc\_user.h* include file. This *ioctl* provides useful driver information.

**IOCTL\_CCURPMFC\_GET\_PHYSICAL\_MEMORY:** The argument supplied to this *ioctl* is a pointer to the *ccurpmfc\_user\_phys\_mem\_t* structure. Information on the structure is located in the *ccurpmfc\_user.h* include file. If physical memory is not allocated, the call will fail; otherwise the call will return the physical memory address and size in bytes. The only reason to request and get physical memory from the driver is to allow the user to perform DMA operations and bypass the driver and library. Care must be taken when performing user level DMA, as incorrect programming could lead to unpredictable results, including but not limited to corrupting the kernel and any device connected to the system.

**IOCTL\_CCURPMFC\_GET\_ADC\_READ\_MODE:** The argument supplied to this *ioctl* is a pointer to an *unsigned long int*. The value returned will be one of the ADC read modes as defined by the *enum\_ccurpmfc\_driver\_ADC\_read\_mode\_t* located in the *ccurpmfc\_user.h* include file.

**IOCTL\_CCURPMFC\_GET\_DAC\_WRITE\_MODE:** The argument supplied to this *ioctl* is a pointer to an *unsigned long int*. The value returned will be one of the DAC write modes as defined by the *enum\_ccurpmfc\_driver\_DAC\_write\_mode\_t* located in the *ccurpmfc\_user.h* include file.

**IOCTL\_CCURPMFC\_INIT\_BOARD:** This *ioctl* does not have any arguments. This call resets the board to a known initial default state. This call is currently identical to the *IOCTL\_CCURPMFC\_RESET\_BOARD* call.

**IOCTL\_CCURPMFC\_INTERRUPT\_TIMEOUT\_SECONDS:** The argument supplied to this *ioctl* is a pointer to an *int*. It allows the user to change the default time out from 30 seconds to user supplied time out. This is the time that the read call will wait before it times out. The call could time out if a DMA fails to complete. The device should have been opened in the block mode (*O\_NONBLOCK* not set) for reads to wait for an operation to complete.

**IOCTL\_CCURPMFC\_MMAP\_SELECT:** The argument to this *ioctl* is a pointer to the *ccurpmfc\_mmap\_select\_t* structure. Information on the structure is located in the *ccurpmfc\_user.h* include file. This call needs to be made prior to the *mmap(2)* system call so as to direct the *mmap(2)* call to perform the requested mapping specified by this *ioctl*. The four possible mappings that are performed by the driver are to *mmap* the local register space (*CCURPMFC\_SELECT\_LOCAL\_MMAP*), the configuration register space (*CCURPMFC\_SELECT\_CONFIG\_MMAP*) the physical memory (*CCURPMFC\_SELECT\_PHYS\_MEM\_MMAP*) that is created by the *mmap(2)* system call and the driver/library mapping (*CCURPMFC\_SELECT\_DRIVER\_LIBRARY\_MMAP*).

**IOCTL\_CCURPMFC\_NO\_COMMAND:** This *ioctl* does not have any arguments. It is only provided for debugging purpose and should not be used as it serves no purpose for the application.

**IOCTL\_CCURPMFC\_PCI\_CONFIG\_REGISTERS:** The argument supplied to this *ioctl* is a pointer to the *ccurpmfc\_pci\_config\_reg\_addr\_mapping\_t* structure whose definition is located in the *ccurpmfc\_user.h* include file.

**IOCTL\_CCURPMFC\_REMOVE\_IRQ:** This *ioctl* does not have any arguments. Its purpose is to remove the interrupt handler that was previously setup. The interrupt handler is managed internally by the driver and the library. The user should not issue this call, otherwise reads will time out.

**IOCTL\_CCURPMFC\_RESET\_BOARD:** This *ioctl* does not have any arguments. This call resets the board to a known initial default state. This call is currently identical to the *IOCTL\_CCURPMFC\_INIT\_BOARD* call.

**IOCTL\_CCURPMFC\_SELECT\_ADC\_READ\_MODE:** The argument supplied to this *ioctl* is a pointer to an *unsigned long int*. The value set will be one of the ADC read modes as defined by the *enum \_ccurpmfc\_driver\_adc\_read\_mode\_t* located in the *ccurpmfc\_user.h* include file.

**IOCTL\_CCURPMFC\_SELECT\_DAC\_WRITE\_MODE:** The argument supplied to this *ioctl* is a pointer to an *unsigned long int*. The value set will be one of the DAC write modes as defined by the *enum \_ccurpmfc\_driver\_dac\_write\_mode\_t* located in the *ccurpmfc\_user.h* include file.

**IOCTL\_CCURPMFC\_WAIT\_FOR\_INTERRUPT:** The argument to this *ioctl* is a pointer to the *ccurpmfc\_driver\_int\_t* structure. Information on the structure is located in the *ccurpmfc\_user.h* include file. The user can wait for a DMA or Analog signal complete interrupt. If a time out value greater than zero is specified, the call will time out after the specified seconds, otherwise it will not time out.

**IOCTL\_CCURPMFC\_WAIT\_FOR\_DAC\_FIFO\_TO\_DRAIN:** The argument to this *ioctl* is a pointer to *threshold*. The call will block until the samples in the DAC FIFO falls below the threshold value.

**IOCTL\_CCURPMFC\_RELOAD\_FIRMWARE:** This *ioctl* does not have any arguments. This call performs a reload of the latest firmware that was loaded into the board. Typically, this is used after a new firmware has been installed. It eliminates the need to reboot the kernel after a firmware update.

**IOCTL\_CCURPMFC\_GET\_ALL\_BOARDS\_DRIVER\_INFO:** The argument to this *ioctl* is a pointer to *ccurpmfc\_all\_boards\_driver\_info*. It provides the ability to supply all driver information for all the *ccurpmfc* cards in the system to the user.

**IOCTL\_CCURPMFC\_WAKEUP\_DIO\_COS\_INTERRUPT:** This *ioctl* does not have any arguments. The purpose of this call is to wake up a process that is blocked using the *IOCTL\_CCURPMFC\_WAIT\_FOR\_DIO\_COS\_INTERRUPT* *ioctl* waiting for a DIO change-of-state interrupt.

**IOCTL\_CCURPMFC\_WAIT\_FOR\_DIO\_COS\_INTERRUPT:** The argument to this *ioctl* is a pointer to the *ccurpmfc\_driver\_dio\_cos\_int\_t* structure. Information on the structure is located in the *ccurpmfc\_user.h* include file. The user can wait for a DIO complete interrupt with the *WakeupInterruptMas* mask. This call blocks indefinitely until a DIO change-of-state interrupt occurs. If a change-of-state interrupt occurs, this call returns useful DIO related statistics to the user. To cancel a pending wait, users can use the *IOCTL\_CCURPMFC\_WAKEUP\_DIO\_COS\_INTERRUPT* *ioctl()* call.

### 2.1.3 mmap(2) system call

This system call provides the ability to map either the local board registers, the configuration board registers, create and map a physical memory that can be used for user DMA or driver/library structure mapping. Prior to making this system call, the user needs to issue the *ioctl(2)* system call with the *IOCTL\_CCURPMFC\_MMAP\_SELECT* command. When mapping either the local board registers or the configuration board registers, the *ioctl* call returns the size of the register mapping which needs to be specified in the *mmap(2)* call. In the case of mapping a physical memory, the size of physical memory to be created is supplied to the *mmap(2)* call.

```
int *munmap_local_ptr;
```

```

ccurpmfc_local_ctrl_data_t *local_ptr;
ccurpmfc_mmap_select_t mmap_select;
unsigned long mmap_local_size;

mmap_select.select = CCURPMFC_SELECT_LOCAL_MMAP;
mmap_select.offset=0;
mmap_select.size=0;
ioctl(fp, IOCTL_CCURPMFC_MMAP_SELECT,(void *)&mmap_select);
mmap_local_size = mmap_select.size;

munmap_local_ptr = (int *) mmap((caddr_t)0, mmap_local_size,
                                (PROT_READ|PROT_WRITE), MAP_SHARED, fp, 0);

local_ptr = (ccurpmfc_local_ctrl_data_t *)munmap_local_ptr;
local_ptr = (ccurpmfc_local_ctrl_data_t *)((char *)local_ptr +
                                           mmap_select.offset);

.
.
.

if(munmap_local_ptr != NULL)
    munmap((void *)munmap_local_ptr, mmap_local_size);

```

#### 2.1.4 read(2) system call

This system call currently supports ADC programmed I/O reads of channel registers and FIFO. The option selected is determined by the *ccurPMFC\_ADC\_Set\_Driver\_Read\_Mode()* call.

CCURPMFC\_ADC\_PIO\_CHANNEL: Perform .channel registers programmed I/O reads.

CCURPMFC\_ADC\_PIO\_FIFO: Perform FIFO reads using programmed I/O.

#### 2.1.5 write(2) system call

This system call currently supports DAC programmed I/O writes of channel registers and FIFO. The option selected is determined by the *ccurPMFC\_DAC\_Set\_Driver\_Write\_Mode()* call.

CCURPMFC\_DAC\_PIO\_CHANNEL: Perform .channel registers programmed I/O writes.

CCURPMFC\_DAC\_PIO\_FIFO: Perform FIFO writes using programmed I/O.

## 2.2 Application Program Interface (API) Access

The API is the recommended method of communicating with the board for most users.

There are a lot of APIs that have multiple arguments to set various parameters. If the user only wishes to change certain parameters for the call, they need to get the current settings via a query API, change only those parameters that need to be modified and then invoke a setting API to update these parameters (*i.e. read/modify/write*). This is a two API call operation.

A nice feature has been implemented in these APIs to simplify the user programming by having a common parameter `CCURPMFC_DO_NOT_CHANGE` which is a `#define`, that can be used for a lot of these calls. Arguments with this parameter will therefore cause the API to perform the read/modify/write operation instead of the user performing the same function with two API calls. The drawback to this approach is that some compilers will complain about the use of this parameter and therefore the user will require appropriate casting to get rid of warnings/errors.

The following are a list of calls that are available.

```
ccurPMFC_Abort_DMA()
ccurPMFC_ADC_Activate()
ccurPMFC_ADC_Get_CSR()
ccurPMFC_ADC_Get_Driver_Read_Mode()
ccurPMFC_ADC_Get_Fifo_Channel_Select()
ccurPMFC_ADC_Get_Fifo_Info()
ccurPMFC_ADC_Get_Fifo_Threshold()
ccurPMFC_ADC_Get_Negative_Cal()
ccurPMFC_ADC_Get_Offset_Cal()
ccurPMFC_ADC_Get_Positive_Cal()
ccurPMFC_ADC_Perform_Auto_Calibration()

ccurPMFC_Write()
```

### 2.2.1 ccurPMFC\_Abort\_DMA()

This call will abort any DMA operation that is in progress. Normally, the user should not use this call unless they are providing their own DMA handling.

```

/*****
  _ccurpmfc_lib_error_number_t ccurPMFC_Abort_DMA(void *Handle)

Description: Abort any DMA in progress

Input:   void *Handle           (Handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN          (device not open)
         # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
         # CCURPMFC_LIB_IOCTL_FAILED      (driver ioctl call failed)
*****/

```

### 2.2.2 ccurPMFC\_ADC\_Activate()

This call must be the first call to activate the ADC. Without activation, all other calls to the ADC will fail. The user can also use this call to return the current state of the ADC without any change by specifying a pointer to *current\_state* and setting *activate* to *CCURPMFC\_ADC\_ALL\_ENABLE\_DO\_NOT\_CHANGE*. If the ADC is already active and the user issues a *CCURPMFC\_ADC\_ALL\_ENABLE*, no additional activation will be performed. To cause the ADC to go through a full reset, the user needs to issue the *CCURPMFC\_ADC\_ALL\_RESET* which will cause the ADC to disable and then re-enable, setting all its ADC values to a default state. ADC calibration data will also be reset.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_ADC_Activate (void           *Handle,
                        _ccurpmfc_adc_all_enable_t activate,
                        _ccurpmfc_adc_all_enable_t *current_state)

Description: Activate/DeActivate ADC module

Input:   void           *Handle           (Handle pointer)
         _ccurpmfc_adc_all_enable_t activate (activate/deactivate)
         # CCURPMFC_ADC_ALL_DISABLE
         # CCURPMFC_ADC_ALL_ENABLE
         # CCURPMFC_ADC_ALL_RESET       (disable followed by enable)
         # CCURPMFC_ADC_ALL_ENABLE_DO_NOT_CHANGE
Output:  _ccurpmfc_adc_all_enable_t *current_state (active/deactive)
         # CCURPMFC_ADC_ALL_DISABLE
         # CCURPMFC_ADC_ALL_ENABLE
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN          (device not open)
         # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
*****/

```

### 2.2.3 ccurPMFC\_ADC\_Get\_CSR()

This call returns information from the ADC registers for the selected channel group.

```

/*****

```

```

_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Get_CSR (void *Handle,
                      _ccurpmfc_adc_mask_t adc_mask,
                      ccurpmfc_adc_csr_t *adc_csr)

```

Description: Get ADC Control and Status information

```

Input:  void *Handle (Handle pointer)
        _ccurpmfc_adc_mask_t adc_mask (selected ADC mask)
        # CCURPMFC_ADC_MASK_0_7
        # CCURPMFC_ADC_MASK_8_15
        # CCURPMFC_ALL_ADC_MASK

Output: ccurpmfc_adc_csr_t *adc_csr (pointer to ADC csr)
        _ccurpmfc_adccsr_update_clock_t adc_update_clock;

*****/

```

## 2.2.4 ccurPMFC\_ADC\_Get\_Driver\_Read\_Mode()

This call returns the current driver ADC read mode. When a *read(2)* system call is issued, it is this mode that determines the type of read being performed by the driver.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Get_Driver_Read_Mode (void *Handle,
                                   _ccurpmfc_driver_ADC_read_mode_t *mode)

```

Description: Get current ADC read mode that will be selected by the 'read()' call

```

Input:  void *Handle (Handle pointer)
Output: _ccurpmfc_driver_ADC_read_mode_t *mode (select ADC read mode)
        # CCURPMFC_ADC_PIO_CHANNEL
        # CCURPMFC_ADC_PIO_FIFO

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR (successful)
        # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN (library not open)

```

```

# CCURPMFC_LIB_NO_LOCAL_REGION          (local region not present)
# CCURPMFC_LIB_IOCTL_FAILED             (driver ioctl call failed)
# CCURPMFC_LIB_INVALID_ARG              (invalid argument)
*****

```

## 2.2.5 ccurPMFC\_ADC\_Get\_Fifo\_Channel\_Select()

This call returns the current Fifo Channel selection mask. Only samples for these selected channels are placed in the fifo during sample collection.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Get_Fifo_Channel_Select(void      *Handle,
                                       _ccurpmfc_adc_channel_mask_t *adc_fifo_channel_select_mask)

```

Description: ADC Get Fifo Channel Selection

Input: void \*Handle (handle pointer)  
Output: \_ccurpmfc\_adc\_channel\_mask\_t \*adc\_fifo\_channel\_select\_mask (channel select mask)

```

# CCURPMFC_ADC_CHANNEL_MASK_0
# CCURPMFC_ADC_CHANNEL_MASK_1
# CCURPMFC_ADC_CHANNEL_MASK_2
# CCURPMFC_ADC_CHANNEL_MASK_3
# CCURPMFC_ADC_CHANNEL_MASK_4
# CCURPMFC_ADC_CHANNEL_MASK_5
# CCURPMFC_ADC_CHANNEL_MASK_6
# CCURPMFC_ADC_CHANNEL_MASK_7
# CCURPMFC_ADC_CHANNEL_MASK_8
# CCURPMFC_ADC_CHANNEL_MASK_9
# CCURPMFC_ADC_CHANNEL_MASK_10
# CCURPMFC_ADC_CHANNEL_MASK_11
# CCURPMFC_ADC_CHANNEL_MASK_12
# CCURPMFC_ADC_CHANNEL_MASK_13
# CCURPMFC_ADC_CHANNEL_MASK_14
# CCURPMFC_ADC_CHANNEL_MASK_15
# CCURPMFC_ALL_ADC_CHANNELS_MASK

```

Return: \_ccurpmfc\_lib\_error\_number\_t

```

# CCURPMFC_LIB_NO_ERROR          (successful)
# CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN          (device not open)
# CCURPMFC_LIB_INVALID_ARG       (invalid argument)
# CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
# CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)

```

```

*****

```

## 2.2.6 ccurPMFC\_ADC\_Get\_Fifo\_Info()

This call returns ADC FIFO information to the user.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Get_Fifo_Info(void      *Handle,
                                ccurpmfc_adc_fifo_info_t *adc_fifo)

```

Description: Get ADC FIFO control and Status information

Input: void \*Handle (Handle pointer)  
Output: ccurpmfc\_adc\_fifo\_info\_t \*adc\_fifo (pointer to ADC fifo struct)

```

_ccurpmfc_adc_fifo_reset_t reset;

```

```

    # CCURPMFC_ADC_FIFO_ACTIVE
    # CCURPMFC_ADC_FIFO_RESET
    _ccurpmfc_adc_fifo_overflow_t    overflow;
    # CCURPMFC_ADC_FIFO_NO_OVERFLOW
    # CCURPMFC_ADC_FIFO_OVERFLOW
    _ccurpmfc_adc_fifo_underflow_t  underflow;
    # CCURPMFC_ADC_FIFO_NO_UNDERFLOW
    # CCURPMFC_ADC_FIFO_UNDERFLOW
    _ccurpmfc_adc_fifo_full_t       full;
    # CCURPMFC_ADC_FIFO_NOT_FULL
    # CCURPMFC_ADC_FIFO_FULL

    uint                               threshold;
    uint                               max_threshold;
    uint                               driver_threshold;
    _ccurpmfc_adc_channel_mask_t     channel_select_mask;
    # CCURPMFC_ADC_CHANNEL_MASK_0
    # CCURPMFC_ADC_CHANNEL_MASK_1
    # CCURPMFC_ADC_CHANNEL_MASK_2
    # CCURPMFC_ADC_CHANNEL_MASK_3
    # CCURPMFC_ADC_CHANNEL_MASK_4
    # CCURPMFC_ADC_CHANNEL_MASK_5
    # CCURPMFC_ADC_CHANNEL_MASK_6
    # CCURPMFC_ADC_CHANNEL_MASK_7
    # CCURPMFC_ADC_CHANNEL_MASK_8
    # CCURPMFC_ADC_CHANNEL_MASK_9
    # CCURPMFC_ADC_CHANNEL_MASK_10
    # CCURPMFC_ADC_CHANNEL_MASK_11
    # CCURPMFC_ADC_CHANNEL_MASK_12
    # CCURPMFC_ADC_CHANNEL_MASK_13
    # CCURPMFC_ADC_CHANNEL_MASK_14
    # CCURPMFC_ADC_CHANNEL_MASK_15
    # CCURPMFC_ALL_ADC_CHANNELS_MASK
Return:  _ccurpmfc_lib_error_number_t
    # CCURPMFC_LIB_NO_ERROR           (successful)
    # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
    # CCURPMFC_LIB_NOT_OPEN          (device not open)
    # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
    # CCURPMFC_LIB_NO_LOCAL_REGION    (local region not present)
    # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/

```

## 2.2.7 ccurPMFC\_ADC\_Get\_Fifo\_Threshold()

This call returns the ADC Fifo threshold information.

```

/*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_ADC_Get_Fifo_Threshold(void *Handle,
                                    uint *adc_threshold)

```

Description: ADC Get Fifo Threshold

Input: void \*Handle (handle pointer)  
Output: uint \*adc\_threshold (ADC fifo threshold)

```

Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)
        # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/

```

## 2.2.8 ccurPMFC\_ADC\_Get\_Negative\_Cal()

This call returns the ADC negative calibration information for all the channels.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Get_Negative_Cal(void          *Handle,
                               ccurpmfc_adc_cal_t *cal)

Description: Get the ADC Negative Calibration data.

Input:  void          *Handle (handle pointer)
Output: ccurpmfc_adc_cal_t *cal (pointer to board cal)
        uint Raw[CCURPMFC_MAX_ADC_CHANNELS];
        double Float[CCURPMFC_MAX_ADC_CHANNELS];

Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)
        # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/

```

## 2.2.9 ccurPMFC\_ADC\_Get\_Offset\_Cal()

This call returns the ADC offset calibration information for all the channels.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Get_Offset_Cal(void          *Handle,
                               ccurpmfc_adc_cal_t *cal)

Description: Get the ADC Offset Calibration data.

Input:  void          *Handle (handle pointer)
Output: ccurpmfc_adc_cal_t *cal (pointer to board cal)
        uint Raw[CCURPMFC_MAX_ADC_CHANNELS];
        double Float[CCURPMFC_MAX_ADC_CHANNELS];

Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)
        # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/

```

## 2.2.10 ccurPMFC\_ADC\_Get\_Positive\_Cal()

This call returns the ADC positive calibration information for all the channels.

```

/*****

```

```

_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Get_Positive_Cal(void          *Handle,
                               ccurpmfc_adc_cal_t *cal)

```

Description: Get the ADC Positive Calibration data.

```

Input:  void          *Handle (handle pointer)
Output: ccurpmfc_adc_cal_t *cal (pointer to board cal)
        uint         Raw[CCURPMFC_MAX_ADC_CHANNELS];
        double       Float[CCURPMFC_MAX_ADC_CHANNELS];
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN        (device not open)
        # CCURPMFC_LIB_INVALID_ARG     (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)

```

\*\*\*\*\*/

## 2.2.11 ccurPMFC\_ADC\_Perform\_Auto\_Calibration()

This single call performs a full ADC calibration of all the channels using the internal reference voltages.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Perform_Auto_Calibration(void *Handle)

```

Description: Perform ADC Auto Calibration

```

Input:  void *Handle (handle pointer)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN        (library not open)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_NO_RESOURCE     (no free PLL available)
        # CCURPMFC_LIB_IO_ERROR        (read error)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)

```

\*\*\*\*\*/

## 2.2.12 ccurPMFC\_ADC\_Perform\_External\_Negative\_Calibration()

Use this call to perform an external negative calibration. Prior to calling this function, the ADC inputs must be provided with a negative signal close to -10 Volts, otherwise this call will fail. Additionally, the user can specify a range of channels.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Perform_External_Negative_Calibration(void *Handle,
                                                    _ccurpmfc_adc_channel_t chan_start,
                                                    _ccurpmfc_adc_channel_t chan_end,
                                                    double ReferenceVoltage)

```

Description: Perform ADC External Negative Calibration

```

Input:  void          *Handle (handle pointer)
        _ccurpmfc_adc_channel_t chan_start (start channel)
        _ccurpmfc_adc_channel_t chan_end (end channel)
        double         ReferenceVoltage (Reference Voltage)

```

```

Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (library not open)
        # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
        # CCURPMFC_LIB_NO_RESOURCE       (no free PLL available)
        # CCURPMFC_LIB_IO_ERROR          (read error)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
*****/

```

### 2.2.13 ccurPMFC\_ADC\_Perform\_External\_Offset\_Calibration()

Use this call to perform an external offset calibration. Prior to calling this function, the ADC inputs must be provided with a offset signal close to 0 Volts, otherwise this call will fail. Additionally, the user can specify a range of channels. Once this call is executed, the user will need to perform external negative and external positive calibrations as this call resets these gains to 1.0 prior to calibration.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Perform_External_Offset_Calibration(void      *Handle,
                                                  _ccurpmfc_adc_channel_t chan_start,
                                                  _ccurpmfc_adc_channel_t chan_end)

```

Description: Perform ADC External Offset Calibration

```

Input: void      *Handle      (handle pointer)
       _ccurpmfc_adc_channel_t chan_start (start channel)
       _ccurpmfc_adc_channel_t chan_end  (end channel)

Output: none

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (library not open)
        # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
        # CCURPMFC_LIB_NO_RESOURCE       (no free PLL available)
        # CCURPMFC_LIB_IO_ERROR          (read error)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
*****/

```

### 2.2.14 ccurPMFC\_ADC\_Perform\_External\_Positive\_Calibration()

Use this call to perform an external positive calibration. Prior to calling this function, the ADC inputs must be provided with a positive signal close to +10 Volts, otherwise this call will fail. Additionally, the user can specify a range of channels.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Perform_External_Positive_Calibration(void      *Handle,
                                                  _ccurpmfc_adc_channel_t chan_start,
                                                  _ccurpmfc_adc_channel_t chan_end,
                                                  double          ReferenceVoltage)

```

Description: Perform ADC External Positive Calibration

```

Input: void      *Handle      (handle pointer)
       _ccurpmfc_adc_channel_t chan_start (start channel)

```

```

        _ccurpmfc_adc_channel_t chan_end          (end channel)
        double                    ReferenceVoltage (Reference Voltage)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN                (library not open)
        # CCURPMFC_LIB_INVALID_ARG            (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION         (local region not present)
        # CCURPMFC_LIB_NO_RESOURCE            (no free PLL available)
        # CCURPMFC_LIB_IO_ERROR                (read error)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE       (ADC is not active)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE     (Clock is not active)
*****/

```

### 2.2.15 ccurPMFC\_ADC\_Perform\_Negative\_Calibration()

This call performs a negative calibration using the internal reference voltage.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Perform_Negative_Calibration(void *Handle)

Description: Perform ADC Negative Calibration

Input:  void   *Handle          (handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN                (library not open)
        # CCURPMFC_LIB_NO_LOCAL_REGION         (local region not present)
        # CCURPMFC_LIB_NO_RESOURCE            (no free PLL available)
        # CCURPMFC_LIB_IO_ERROR                (read error)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE       (ADC is not active)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE     (Clock is not active)
*****/

```

### 2.2.16 ccurPMFC\_ADC\_Perform\_Offset\_Calibration()

This call performs an offset calibration using the internal reference voltage. Once this call is executed, the user will need to perform negative and positive calibrations as this call resets these gains to 1.0 prior to calibration.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Perform_Offset_Calibration(void *Handle)

Description: Perform ADC Offset Calibration

Input:  void   *Handle          (handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)

        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE     (Clock is not active)
*****/

```

\*\*\*\*\*/

## 2.2.17 `ccurPMFC_ADC_Perform_Positive_Calibration()`

This call performs a positive calibration using the internal reference voltage.

/\*\*\*\*\*

```
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Perform_Positive_Calibration(void *Handle)
```

Description: Perform ADC Positive Calibration

```
Input:  void    *Handle          (handle pointer)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN      (library not open)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_NO_RESOURCE   (no free PLL available)
        # CCURPMFC_LIB_IO_ERROR      (read error)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
```

\*\*\*\*\*/

## 2.2.18 `ccurPMFC_ADC_Read_Channels ()`

This call provides the user an easy method of reading the ADC channels. User can supply a channel mask. If pointer to `adc_csr` is NULL, then the routine itself computes the current ADC configuration. For performance, the user should get the current ADC configuration using the `ccurPMFC_ADC_Get_CSR()` call to get the current settings and pass it to this routine. Hence, if the configuration is not changed, the user can continuously invoke `ccurPMFC_ADC_Read_Channels()` routine without incurring the additional overhead of routine calling the `ccurPMFC_ADC_Get_CSR()` call.

/\*\*\*\*\*

```
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Read_Channels(void *Handle,
                             _ccurpmfc_adc_channel_mask_t ChanMask,
                             _ccurpmfc_adc_csr_t *adc_csr,
                             ccurpmfc_adc_volts_t *adc_volts)
```

Description: Read ADC Channels

```
Input:  void    *Handle          (Handle pointer)
        _ccurpmfc_adc_channel_mask_t ChanMask (specify channel mask)
        # CCURPMFC_ADC_CHANNEL_MASK_0
        # CCURPMFC_ADC_CHANNEL_MASK_1
        # CCURPMFC_ADC_CHANNEL_MASK_2
        # CCURPMFC_ADC_CHANNEL_MASK_3

*****/

```

## 2.2.19 ccurPMFC\_ADC\_Read\_Channels\_Calibration()

This routine reads the ADC channel calibration registers and dumps all of them to the user specified file. If the file name specified is NULL, then information is written to *stdout*.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Read_Channels_Calibration(void *Handle,
                                       char *filename)

```

Description: Read ADC Channels Calibration

```

Input:  void *Handle          (handle pointer)
Output: char *filename       (pointer to filename)
Return: _ccurpmfc_lib_error_number_t
# CCURPMFC_LIB_NO_ERROR          (successful)
# CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN        (library not open)
# CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
# CCURPMFC_LIB_CANNOT_OPEN_FILE (cannot open calib. file)
# CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/

```

## 2.2.20 ccurPMFC\_ADC\_Reset\_Calibration()

This call resets the ADC calibration values on the card.

```

/*****

```

```

    _ccurpmfc_lib_error_number_t
    ccurPMFC_ADC_Reset_Calibration(void *Handle)

```

Description: ADC Reset Calibration

```

Input:   void *Handle (handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN          (device not open)
         # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION    (local region not present)
         # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)

```

```

*****/

```

## 2.2.21 ccurPMFC\_ADC\_Reset\_Fifo()

This call provides the ability to reset the ADC Fifo to the power-on state. User can elect to activate the FIFO after a reset in order for data collection to resume immediately.

```

/*****

```

```

    _ccurpmfc_lib_error_number_t
    ccurPMFC_ADC_Reset_Fifo(void *Handle,
                             _ccurpmfc_adc_fifo_reset_t activate)

```

Description: ADC Reset Fifo

```

Input:   void *Handle (handle pointer)
         _ccurpmfc_adc_fifo_reset_t activate (activate converter)
         # CCURPMFC_ADC_FIFO_ACTIVATE
         # CCURPMFC_ADC_FIFO_RESET
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN          (device not open)
         # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION    (local region not present)
         # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)

```

```

*****/

```

## 2.2.22 ccurPMFC\_ADC\_Set\_CSR()

This call sets the ADC control registers for the selected channel group.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Set_CSR (void          *Handle,
                      _ccurpmfc_adc_mask_t  adc_mask,
                      ccurpmfc_adc_csr_t    *adc_csr)

Description: Set ADC Control and Status information

Input:  void          *Handle (Handle pointer)
        _ccurpmfc_adc_mask_t  adc_mask (selected ADC mask)
        # CCURPMFC_ADC_MASK_0_7
        # CCURPMFC_ADC_MASK_8_15
        # CCURPMFC_ALL_ADC_MASK
        ccurpmfc_adc_csr_t    *adc_csr (pointer to ADC csr)
        _ccurpmfc_adccsr_update_clock_t  adc_update_clock;
        # CCURPMFC_ADC_UPDATE_CLOCK_NONE
        # CCURPMFC_ADC_UPDATE_CLOCK_0
        # CCURPMFC_ADC_UPDATE_CLOCK_1
        # CCURPMFC_ADC_UPDATE_CLOCK_2
        # CCURPMFC_ADC_UPDATE_CLOCK_3
        # CCURPMFC_ADC_UPDATE_CLOCK_4
        # CCURPMFC_ADC_UPDATE_CLOCK_5
        # CCURPMFC_ADC_UPDATE_CLOCK_6
        # CCURPMFC_ADC_UPDATE_CLOCK_DO_NOT_CHANGE
        _ccurpmfc_adccsr_input_signal_t  adc_input_signal;
        # CCURPMFC_ADC_EXTERNAL_SIGNAL
        # CCURPMFC_ADC_CALIBRATION_BUS
        # CCURPMFC_ADC_INPUT_SIGNAL_DO_NOT_CHANGE
        _ccurpmfc_adccsr_data_format_t  adc_data_format;
        # CCURPMFC_ADC_OFFSET_BINARY
        # CCURPMFC_ADC_TWOS_COMPLEMENT
        # CCURPMFC_ADC_DATA_FORMAT_DO_NOT_CHANGE
        _ccurpmfc_adccsr_input_range_t  adc_input_range;
        # CCURPMFC_ADC_BIPOLAR_10V
        # CCURPMFC_ADC_BIPOLAR_5V
        # CCURPMFC_ADC_INPUT_RANGE_DO_NOT_CHANGE

Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN        (library not open)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN        (device not open)
        # CCURPMFC_LIB_INVALID_ARG     (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not
        present)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/
```

## 2.2.23 ccurPMFC\_ADC\_Set\_Driver\_Read\_Mode()

This call sets the current driver ADC read mode. When a *read(2)* system call is issued, it is this mode that determines the type of read being performed by the driver. Refer to the *read(2)* system call under *Direct Driver Access* section for more information on the various modes.

```

/*****
_ccurpmfc_lib_error_number_t
```

```
ccurPMFC_ADC_Set_Driver_Read_Mode (void *Handle,
                                     _ccurpmfc_driver_ADC_read_mode_t mode)
```

Description: Select Driver ADC Read Mode

```
Input: void *Handle (Handle pointer)
       _ccurpmfc_driver_ADC_read_mode_t mode (select ADC read mode)
       # CCURPMFC_ADC_PIO_CHANNEL
       # CCURPMFC_ADC_PIO_FIFO

Output: none

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR (successful)
        # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN (device not open)
        # CCURPMFC_LIB_INVALID_ARG (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
*****/
```

## 2.2.24 ccurPMFC\_ADC\_Set\_Fifo\_Channel\_Select()

This call allows the user to select a set of channels that need to be captured in the ADC Fifo.

```
/******
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Set_Fifo_Channel_Select(void *Handle,
                                     _ccurpmfc_adc_channel_mask_t
                                     adc_fifo_channel_select_mask)
```

Description: ADC Set Fifo Channel Selection

```
Input: void *Handle (handle pointer)
       _ccurpmfc_adc_channel_mask_t adc_fifo_channel_select_mask
       (channel select mask)

       # CCURPMFC_ADC_CHANNEL_MASK_0
       # CCURPMFC_ADC_CHANNEL_MASK_1
       # CCURPMFC_ADC_CHANNEL_MASK_2
       # CCURPMFC_ADC_CHANNEL_MASK_3
       # CCURPMFC_ADC_CHANNEL_MASK_4
       # CCURPMFC_ADC_CHANNEL_MASK_5
       # CCURPMFC_ADC_CHANNEL_MASK_6
       # CCURPMFC_ADC_CHANNEL_MASK_7
       # CCURPMFC_ADC_CHANNEL_MASK_8
       # CCURPMFC_ADC_CHANNEL_MASK_9
       # CCURPMFC_ADC_CHANNEL_MASK_10
       # CCURPMFC_ADC_CHANNEL_MASK_11
       # CCURPMFC_ADC_CHANNEL_MASK_12
       # CCURPMFC_ADC_CHANNEL_MASK_13
       # CCURPMFC_ADC_CHANNEL_MASK_14
       # CCURPMFC_ADC_CHANNEL_MASK_15
       # CCURPMFC_ALL_ADC_CHANNELS_MASK

Output: none

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR (successful)
        # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN (device not open)
        # CCURPMFC_LIB_INVALID_ARG (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/
```

### 2.2.25 ccurPMFC\_ADC\_Set\_Fifo\_Threshold()

This call allows the user to set the ADC Fifo Threshold.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_ADC_Set_Fifo_Threshold(void *Handle,
                                  uint adc_threshold)

Description: ADC Set Fifo Threshold

Input:   void          *Handle      (handle pointer)
         uint          adc_threshold (ADC fifo threshold)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN     (device not open)
         # CCURPMFC_LIB_INVALID_ARG  (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
         # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/
```

### 2.2.26 ccurPMFC\_ADC\_Set\_Negative\_Cal()

This call allows the user to set the negative calibration data for all the channels by supplying floating point *Float* gains to the call. Users can supply CCURPMFC\_DO\_NOT\_CHANGE as a gain for any channel that should not be changed. Additionally, this call will return the *RAW* value of the gain supplied that is written to the board.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_ADC_Set_Negative_Cal(void          *Handle,
                                 ccurpmfc_adc_cal_t *cal)

Description: Set the ADC Negative Calibration data.

Input:   void          *Handle      (handle pointer)
         ccurpmfc_adc_cal_t *cal     (pointer to board cal)
         uint          Raw[CCURPMFC_MAX_ADC_CHANNELS];
         double        Float[CCURPMFC_MAX_ADC_CHANNELS];
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN     (library not open)
         # CCURPMFC_LIB_INVALID_ARG  (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
         # CCURPMFC_LIB_NO_RESOURCE  (no free PLL available)
         # CCURPMFC_LIB_IO_ERROR     (read error)
         # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/
```

### 2.2.27 ccurPMFC\_ADC\_Set\_Offset\_Cal()

This call allows the user to set the offset calibration data for all the channels by supplying floating point *Float* offset to the call. Users can supply CCURPMFC\_DO\_NOT\_CHANGE as a gain for any channel that should not be changed. Additionally, this call will return the *Raw* value of the offset supplied that is written to the board.

```

/*****
```

```

_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Set_Offset_Cal(void          *Handle,
                             ccurpmfc_adc_cal_t *cal)

```

Description: Set the ADC Offset Calibration data.

```

Input:   void          *Handle      (handle pointer)
         ccurpmfc_adc_cal_t      *cal      (pointer to board cal)
         uint          Raw[CCURPMFC_MAX_ADC_CHANNELS];
         double        Float[CCURPMFC_MAX_ADC_CHANNELS];
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)

         # CCURPMFC_LIB_NO_RESOURCE  (no free PLL available)
         # CCURPMFC_LIB_IO_ERROR     (read error)
         # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/

```

### 2.2.28 ccurPMFC\_ADC\_Set\_Positive\_Cal()

This call allows the user to set the positive calibration data for all the channels by supplying floating point *Float* gains to the call. Users can supply CCURPMFC\_DO\_NOT\_CHANGE as a gain for any channel that should not be changed. Additionally, this call will return the *Raw* value of the gain supplied that is written to the board.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Set_Positive_Cal(void          *Handle,
                                ccurpmfc_adc_cal_t *cal)

```

Description: Set the ADC Positive Calibration data.

```

Input:   void          *Handle      (handle pointer)
         ccurpmfc_adc_cal_t      *cal      (pointer to board cal)
         uint          Raw[CCURPMFC_MAX_ADC_CHANNELS];
         double        Float[CCURPMFC_MAX_ADC_CHANNELS];
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN     (library not open)
         # CCURPMFC_LIB_INVALID_ARG  (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
         # CCURPMFC_LIB_NO_RESOURCE  (no free PLL available)
         # CCURPMFC_LIB_IO_ERROR     (read error)
         # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
*****/

```

### 2.2.29 ccurPMFC\_ADC\_Write\_Channels\_Calibration()

This call allows the user to write the calibration registers from a user supplied calibration file. The format of the file is similar to that generated by the *ccurPMFC\_ADC\_Read\_Channels\_Calibration()* call. File can contain comments if they start with '#', '\*', or empty lines. Additionally, users need only specify those channels that they wish to calibrate and the order of specifying channels is not important, however, the format of each channel entry needs to be adhered to. E.g. <chxx:> <negative> <offset> <positive>

```

/*****

```

```
_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Write_Channels_Calibration(void *Handle,
                                         char *filename)
```

Description: Write Channels Calibration

```
Input:   void *Handle           (handle pointer)
Output:  char *filename         (pointer to filename)
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN      (library not open)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_CANNOT_OPEN_FILE (cannot open calib. file)
        # CCURPMFC_LIB_INVALID_ARG   (invalid argument)
        # CCURPMFC_LIB_ADC_IS_NOT_ACTIVE (ADC is not active)
```

\*\*\*\*\*/

e.g.

```

### 2.2.30 ccurPMFC\_Add\_Irq()

This call will add the driver interrupt handler if it has not been added. Normally, the user should not use this call unless they want to disable the interrupt handler and then re-enable it.

```
/******
int ccurPMFC_Add_Irq(void *Handle)
```

Description: By default, the driver assigns an interrupt handler to handle device interrupts. If the interrupt handler was removed using the ccurPMFC\_Remove\_Irq(), then this call adds it back.

```
Input:   void *Handle           (Handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN      (library not open)
        # CCURPMFC_LIB_IOCTL_FAILED  (driver ioctl call failed)
```

\*\*\*\*\*/

### 2.2.31 ccurPMFC\_BoardExpirationTimeRemaining()

This call provides useful information about the expiration date of the card if it has restricted licensing.

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_BoardExpirationTimeRemaining(void          *Handle,
                                         time_t      *SecondsToExpire,
                                         ccurpmfc_date_string_t *GmtDateTimeString,
                                         ccurpmfc_date_string_t *LocalDateTimeString,
                                         _ccurpmfc_firmware_state *FirmwareState)

Description: Number of seconds to expire on a restricted card

Input:  void          *Handle          (Handle pointer)
Output: time_t        *SecondsToExpire (seconds to expire)
        ccurpmfc_date_string_t *GmtDateTimeString (GMT date/time
                                                    string)
        char date[CCURPMFC_DATE_TIME_STRING_SIZE]
        ccurpmfc_date_string_t *LocalDateTimeString (Local date/time
                                                    string)
        char date[CCURPMFC_DATE_TIME_STRING_SIZE]
        _ccurpmfc_firmware_state *FirmwareState (Firmware State)
        # CCURPMFC_FIRMWARE_STATE_UNRESTRICTED
        # CCURPMFC_FIRMWARE_STATE_RESTRICTED
        # CCURPMFC_FIRMWARE_STATE_EXPIRED
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN        (library not open)
*****/

```

Mandatory arguments to the call are *\*Handle* and *\*SecondsToExpire*. Rest of the arguments are optional and be set to *NULL*.

*\*SecondsToExpire* – If the board has an expiration date, this call will return the number of seconds this card can be used before it expires. ***Once the card has expired, this call will not be reached as the device open will fail with an authorization error.***

If the board has no expiration date, this call will return zero as the number of seconds.

*\*GmtDateTimeString* – If the board has an expiration date, this ascii GMT date representation of the expiration date is available in this variable if it is not *NULL*

*\*LocalDateTimeString* – If the board has an expiration date, this ascii Local date representation of the expiration date is available in this variable if it is not *NULL*

*\*FirmwareState* – This returns the current state of the installed firmware. I can be one of:

- *CCURPMFC\_FIRMWARE\_STATE\_UNRESTRICTED*. This firmware has no restrictions.
- *CCURPMFC\_FIRMWARE\_STATE\_RESTRICTED*. This firmware has restrictions. It is possible that and expiration date restriction is not present.
- *CCURPMFC\_FIRMWARE\_STATE\_EXPIRED*. This firmware has restrictions. One of the restrictions is the expiration date which has expired. Typically, you may not see this state as the utility will fail during the open with an authentication error.

### 2.2.32 **ccurPMFC\_Clear\_Driver\_Error()**

This call resets the last driver error that was maintained internally by the driver to *CCURPMFC\_SUCCESS*.

```

/*****
  _ccurpmfc_lib_error_number_t ccurPMFC_Clear_Driver_Error(void *Handle)

Description: Clear any previously generated driver related error.

Input:   void *Handle           (Handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN     (device not open)
         # CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)
*****/

```

### 2.2.33 ccurPMFC\_Clear\_Lib\_Error()

This call resets the last library error that was maintained internally by the API.

```

/*****
  _ccurpmfc_lib_error_number_t ccurPMFC_Clear_Lib_Error(void *Handle)

Description: Clear any previously generated library related error.

Input:   void *Handle           (Handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN     (device not open)
*****/

```

### 2.2.34 ccurPMFC\_Clock\_Generator\_Soft\_Reset()

Perform a soft clock reset on all the output clocks.

```

/*****
  _ccurpmfc_lib_error_number_t ccurPMFC_Clock_Generator_Soft_Reset(void *Handle)

Description: Perform Soft Reset to Clock Generator

Input:   void *Handle           (Handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN     (device not open)
         # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
*****/

```

### 2.2.35 ccurPMFC\_Clock\_Get\_Generator\_CSR()

Return the clock generator control and status register.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_Clock_Get_Generator_CSR (void *Handle,
                                     ccurpmfc_clkgen_csr_t *CgCsr)

Description: Get Generator Control and Status information

Input:   void *Handle           (Handle pointer)
Output:  ccurpmfc_clkgen_csr_t *CgCsr (pointer to clock)
*****/

```

```

generator csr)
_ccurpmfc_clkgen_interface_t      interface
    # CCURPMFC_CLOCK_GENERATOR_INTERFACE_IDLE
    # CCURPMFC_CLOCK_GENERATOR_INTERFACE_BUSY

    # CCURPMFC_CLOCK_GENERATOR_OUTPUT_DISABLE
    # CCURPMFC_CLOCK_GENERATOR_OUTPUT_ENABLE
_ccurpmfc_clkgen_state_t         state
    # CCURPMFC_CLOCK_GENERATOR_ACTIVE
    # CCURPMFC_CLOCK_GENERATOR_RESET
Return: _ccurpmfc_lib_error_number_t
    # CCURPMFC_LIB_NO_ERROR           (successful)
    # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler
                                     supplied)
    # CCURPMFC_LIB_NOT_OPEN          (device not open)
    # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
    # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not
                                     present)
*****/

```

## 2.2.36 ccurPMFC\_Clock\_Get\_Generator\_Info()

This call returns the clock generator information for the selected output.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Get_Generator_Info (void          *Handle,
                                     _ccurpmfc_clock_generator_output_t WhichOutput,
                                     ccurpmfc_clock_generator_info_t      *CgInfo)

```

Description: Get Clock Generator Information

```

Input: void          *Handle (Handle pointer)
       _ccurpmfc_clock_generator_output_t WhichOutput (select output)
       # CCURPMFC_CLOCK_GENERATOR_OUTPUT_0

## 2.2.45 ccurPMFC\_Clock\_Get\_Generator\_Output\_Mux()

Return the clock generator output mux for the selected output.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Get_Generator_Output_Mux (void          *Handle,
        _ccurpmfc_clock_generator_output_t WhichOutput,
        ccurpmfc_clkgen_output_mux_t          *OutMux)

Description: Return Clock Generator Output Mux

Input:  void          *Handle      (Handle pointer)
        _ccurpmfc_clock_generator_output_t WhichOutput (select output)
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_0
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_1
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_2
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_3
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_4
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_5
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_6
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_7
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_8
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_9

Output: ccurpmfc_clkgen_output_mux_t          *OutMux (pointer to output
        inversion/N-divider mux)
        _ccurpmfc_cg_outmux_inversion_t      inversion
        # CCURPMFC_CG_OUTPUT_MUX_COMPLEMENTARY
        # CCURPMFC_CG_OUTPUT_MUX_IN_PHASE
        # CCURPMFC_CG_OUTPUT_MUX_INVERTED
        # CCURPMFC_CG_OUTPUT_MUX_OUT_OF_PHASE
        _ccurpmfc_cg_outmux_ndiv_select_t    ndiv_mux
        # CCURPMFC_CG_OUTPUT_MUX_NDIV_0
        # CCURPMFC_CG_OUTPUT_MUX_NDIV_1
        # CCURPMFC_CG_OUTPUT_MUX_NDIV_2
        # CCURPMFC_CG_OUTPUT_MUX_NDIV_3
        # CCURPMFC_CG_OUTPUT_MUX_NDIV_4

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN                (device not open)
        # CCURPMFC_LIB_INVALID_ARG             (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION         (local region not present)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE     (Clock is not active)
*****/

```

## 2.2.46 ccurPMFC\_Clock\_Get\_Generator\_P\_Divider()

Return the clock generator P-Divider.

        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
*****/

```

## 2.2.48 ccurPMFC\_Clock\_Get\_Generator\_R\_Divider()

Return the clock generator R-Divider for the selected divider.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Get_Generator_R_Divider (void                *Handle,
                                         _ccurpmfc_clock_generator_divider_t WhichDivider,
                                         __u32                    *Divider)

Description: Return Clock Generator R-Divider

Input:  void                *Handle      (Handle pointer)
        _ccurpmfc_clock_generator_divider_t WhichDivider (select divider)
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R0
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R1
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R2
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R3
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R4
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R5
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R6
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R7
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R8
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_R9

Output: __u32                *Divider   (pointer to Divider)
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (device not open)

*****/

```

## 2.2.49 ccurPMFC\_Clock\_Get\_Generator\_Revision()

Return the clock generator revision information.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Get_Generator_Revision (void                *Handle,
                                         ccurpmfc_clock_revision_t *Revision)

Description: Return Clock Generator Revision

Input:  void                *Handle      (Handle pointer)
Output: ccurpmfc_clock_revision_t *Revision (pointer to Divider)
        _ccurpmfc_cg_die_revision_t DieRevision
        # CCURPMFC_CG_SILICON_REVISION_A0
        # CCURPMFC_CG_SILICON_REVISION_A1
        _convert_base_part_number_t BasePartNumber;
        _convert_base_part_number_t
        u_short BPN
        u_char NChar[2]
        _ccurpmfc_cg_clock_speed_grade_t ClockSpeedGrade;
        # CCURPMFC_CG_CLOCK_SPEED_GRADE_A
        # CCURPMFC_CG_CLOCK_SPEED_GRADE_B
        # CCURPMFC_CG_CLOCK_SPEED_GRADE_C
        # CCURPMFC_CG_CLOCK_SPEED_GRADE_D
        _ccurpmfc_cg_clock_revision_t ClockRevision;

        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
*****/

```

### 2.2.50 ccurPMFC\_Clock\_Get\_Generator\_Value()

This is a generic call that can return the value of a valid clock generator address.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Get_Generator_Value (void    *Handle,
                                     int      address,
                                     u_char   *value)

```

Description: Return the value of the specified Clock Generator register.

```

Input:  void          *Handle      (Handle pointer)
        int           address      (clock gen address to display)
Output: u_char        *value;      (pointer to value)
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (device not open)
        # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION    (local region not present)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
*****/

```

### 2.2.51 ccurPMFC\_Clock\_Get\_Generator\_Voltage\_Select()

Return the clock generator Voltage Selection.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Get_Generator_Voltage_Select (void          *Handle,
                                              _ccurpmfc_cg_stat_ctrl_voltsel_t *VoltSel)

```

Description: Return the Clock Generator Voltage Selection

```

Input:  void          *Handle      (Handle pointer)
Output: _ccurpmfc_cg_stat_ctrl_voltsel_t *VoltSel (pointer to voltage select)
        # CCURPMFC_CG_VOLTAGE_SELECT_1_8V
        # CCURPMFC_CG_VOLTAGE_SELECT_3_3V
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (device not open)
        # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION    (local region not present)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
*****/

```

### 2.2.52 ccurPMFC\_Clock\_Get\_Generator\_Zero\_Delay()

Return the clock generator Zero Delay status.

```

/*****

```

```

_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Get_Generator_Zero_Delay (void          *Handle,
                                          _ccurpmfc_cg_zero_delay_t *ZeroDelay)

```

Description: Return the Clock Generator Zero Delay setting.

```

Input:   void          *Handle      (Handle pointer)
Output:  _ccurpmfc_cg_zero_delay_t *ZeroDelay (pointer to zero delay)
        # CCURPMFC_CG_ZERO_DELAY_MODE
        # CCURPMFC_CG_NORMAL_MODE
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN     (device not open)
        # CCURPMFC_LIB_INVALID_ARG  (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
*****/

```

### 2.2.53 ccurPMFC\_Clock\_ReturnOutputFrequency()

This call does not return the actual programmed frequency but instead returns the expected output frequency that would be generated if the specified user input parameters are supplied.

```

/*****
long double
ccurPMFC_Clock_ReturnOutputFrequency(double      InputClock,
                                     long double  Mdiv_value,
                                     long double  Ndiv_value,
                                     double        Pdiv_value,
                                     double        Rdiv_value)

```

Description: Return output frequency

```

Input:   double      InputClock (input clock frequency in Hz)
        long double  Mdiv_value (M-Divider value)
        long double  Ndiv_value (N-Divider value)
        double       Pdiv_value (P-Divider value)
        double       Rdiv_value (R-Divider value)
Output:  none
Return:  long double  returned frequency
*****/

```

### 2.2.54 ccurPMFC\_Clock\_Set\_Generator\_CSR()

This call sets the clock generator control and status register.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Set_Generator_CSR (void          *Handle,
                                  ccurpmfc_clkgen_csr_t *CgCsr)

```

Description: Set Clock Generator Control and Status information

```

Input:   void          *Handle      (Handle pointer)
        ccurpmfc_clkgen_csr_t *CgCsr (pointer to clock generator csr)
        _ccurpmfc_clkgen_output_t output
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_DISABLE
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_ENABLE
        # CCURPMFC_CLOCK_GENERATOR_OUTPUT_DO_NOT_CHANGE
        _ccurpmfc_clkgen_state_t state

```

```

# CCURPMFC_CLOCK_GENERATOR_ACTIVE
# CCURPMFC_CLOCK_GENERATOR_RESET
# CCURPMFC_CLOCK_GENERATOR_STATE_DO_NOT_CHANGE
Output: none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN          (device not open)
         # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
*****/

```

## 2.2.55 ccurPMFC\_Clock\_Set\_Generator\_Input\_Clock\_Enable()

This call sets the input clock status for the input clocks. *Normally, this call should not be used. It is recommended that only advanced users should use this call and with extreme care and intimate knowledge of the clock programming, otherwise results would be indeterminate.*

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Set_Generator_Input_Clock_Enable (void      *Handle,
          ccurpmfc_clkgen_input_clock_enable_t  *InputClockEnable)

```

Description: Set Clock Generator Input Clock Enable

```

Input:  void      *Handle      (Handle
          ccurpmfc_clkgen_input_clock_enable_t *InputClockEnable (pointer to
          input clock enable)
         _ccurpmfc_cg_input_clock_enable_t  input_0_clock
         # CCURPMFC_CG_INPUT_CLOCK_DISABLE
         # CCURPMFC_CG_INPUT_CLOCK_ENABLE
         # CCURPMFC_CG_INPUT_CLOCK_DO_NOT_CHANGE
         _ccurpmfc_cg_input_clock_enable_t  input_1_clock
         # CCURPMFC_CG_INPUT_CLOCK_DISABLE
         # CCURPMFC_CG_INPUT_CLOCK_ENABLE
         # CCURPMFC_CG_INPUT_CLOCK_DO_NOT_CHANGE
         _ccurpmfc_cg_input_clock_enable_t  input_2_clock
         # CCURPMFC_CG_INPUT_CLOCK_DISABLE
         # CCURPMFC_CG_INPUT_CLOCK_ENABLE
         # CCURPMFC_CG_INPUT_CLOCK_DO_NOT_CHANGE
         _ccurpmfc_cg_input_clock_enable_t  input_fb_clock
         # CCURPMFC_CG_INPUT_CLOCK_DISABLE
         # CCURPMFC_CG_INPUT_CLOCK_ENABLE
         # CCURPMFC_CG_INPUT_CLOCK_DO_NOT_CHANGE
Output: none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)

*****/

```

## 2.2.57 ccurPMFC\_Clock\_Set\_Generator\_M\_Divider()

This call sets the clock generator M-Divider to the user specified Numerator and Denominator. If the Update flag is set, then the change will take place after the divider has been written to. *Normally, this call should not be used. It is recommended that only advanced users should use this call and with extreme care and intimate knowledge of the clock programming, otherwise results would be indeterminate.*

```

## 2.2.66 ccurPMFC\_Clock\_Set\_Generator\_Value()

This is a generic call that can program a valid clock generator address to a desired value. User must be intimately familiar with the hardware before programming the values. In-correct programming could result in unpredictable results. *Normally, this call should not be used. It is recommended that only advanced users should use this call and with extreme care and intimate knowledge of the clock programming, otherwise results would be indeterminate.*

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Clock_Set_Generator_Value (void    *Handle,
                                     int      address,
                                     u_char   value)

Description: Set the value of the specified Clock Generator register.

Input:  void    *Handle    (Handle pointer)
        int      address    (clock gen address to set)
        u_char   value;     (value to write)

```

```

Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)

## 2.2.69 ccurPMFC\_Close()

This call is used to close an already opened device using the *ccurPMFC\_Open()* call.

```

/*****
_ccurpmfc_lib_error_number_t ccurPMFC_Close(void *Handle)

```

Description: Close a previously opened device.

```

Input:  void *Handle          (Handle pointer)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN      (device not open)
*****/

```

## 2.2.70 ccurPMFC\_Compute\_All\_Output\_Clocks()

This call does not program the clock outputs but instead returns to the user whether the board can be programmed with the user selected output clock frequencies. Additionally, useful information is returned to the user in a structure for each clock that was computed.

```

/*****

```

```

ccurPMFC_Compute_All_Output_Clocks()

```

Description: Compute All Output Clocks

```

Input:  void          *Handle          (Handle pointer)
        double        InputClockFrequency (Input clock
        ccurpmfc_compute_all_output_clocks_t *AllClocks (Pointer to all

### 2.2.71 ccurPMFC\_Convert\_Physmem2avmm\_Address()

This call is used to supply the user with an Avalon equivalent Address for the supplied Physical DMA memory. This Avalon equivalent address can then be supplied to the DMA engine to perform DMA operations.

```

/*****
__ccurpmfc_lib_error_number_t
ccurPMFC_Convert_Physmem2avmm_Address(void      *Handle,
                                         uint     *PhysDmaMemPtr,
                                         uint     *AvalonAddress)

```

Description: Get the converted value of Physical DMA memory to Avalon address to be supplied as address for DMA operations.

```

Input:  void      *Handle      (Handle pointer)
        uint     *PhysDmaMemPtr (pointer to physical DMA
                                memory)
Output: uint      *AvalonAddress (pointer to Avalon
                                Address).
Return: __ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN                (library not open)
        # CCURPMFC_LIB_INVALID_ARG             (invalid argument)
        # CCURPMFC_LIB_AVALON_TRANSLATION_TABLE (avalon translation table

        # CCURPMFC_LIB_ADDRESS_RANGE_ERROR     (address range error)
*****/

```

### 2.2.72 ccurPMFC\_Create\_UserDioCosInterruptHandler()

This call provides the ability for a user to get notification when a DIO change-of-state interrupt occurs. Prior to invoking this call, the user needs to create an *interrupt callback* function which is supplied to this call as

one of its inputs. Additionally, the user selects a set of DIO COS wakeup masks to enter the user supplied callback when a corresponding interrupt occurs. On successful completion of this call, a real-time high priority thread is created and blocked waiting for DIO COS interrupts. When a DIO COS interrupt occurs, the driver will wake up this thread which in turn will execute the user supplied *interrupt callback* function. Various DIO COS statistics will be returned to the user as an argument *driver\_dio\_cos\_int* supplied to the *interrupt callback* routine everytime a wakeup occurs. The user needs to ensure that the processing within this *interrupt callback* should be completed in as short a time as possible for the thread to be ready in time to accept the next DIO COS interrupt. Failure to do so will result in missed change-of-state interrupts.

If the interrupt handler has already been created for a device, then the user will be unable to create another one as only one interrupt handler is assigned to each device. User will need to destroy the interrupt handler with the *ccurPMFC\_Destroy\_UserDioCosInterruptHandler()* call prior to creating a new one.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_Create_UserDioCosInterruptHandler(void      *Handle,
                                              void      Callback(),
                                              u_int      DioCosWakeupInterruptMask)

```

Description: Create a User DIO COS Interrupt Handler

```

Input:  void      *Handle      (Handle pointer)
        void      Callback()   (user callback function)
        u_int      DioCosWakeupInterruptMask (wakeup interrupt mask)

### 2.2.73 ccurPMFC\_Create\_UserProcess()

Typically reads from h/w take a finite time to complete. If the user has a process that is time critical and needs to read the latest data faster, they may use a new approach called Hyper-Drive. In this case, the user defines a thread with this call, which continuously reads the data from the board and holds the latest values. The user process can then access this latest data at substantially faster rates. The two drawbacks to this approach is that the excessive bus assess is made and dedicated CPUs are required.

This call is used to create this User Process looping thread which can be controlled by the user via the returned handle. *(This is an experimental API for debugging and testing).*

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Create_UserProcess(void          *Handle,
                               _ccurpmfc_UserFunction_t *UFunc,
                               _ccurpmfc_UserFunction_t **UFuncHandle)

```

Description: Create a User Process for user defined processing

Input:	void	*Handle	(Handle pointer)
	_ccurpmfc_UserFunction_t	*UFunc	(pointer to user information structure)

## 2.2.74 ccurPMFC\_DAC\_Activate()

This call must be the first call to activate the DAC. Without activation, all other calls to the DAC will fail. The user can also use this call to return the current state of the DAC without any change by specifying a pointer to *current\_state* and setting *activate* to *CCURPMFC\_DAC\_ALL\_ENABLE\_DO\_NOT\_CHANGE*. If the DAC is already active and the user issues a *CCURPMFC\_DAC\_ALL\_ENABLE*, no additional activation will be performed. To cause the DAC to go through a full reset, the user needs to issue the *CCURPMFC\_DAC\_ALL\_RESET* which will cause the DAC to disable and then re-enable, setting all its DAC values to a default state. DAC calibration data will also be reset.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Activate (void *Handle,
                      _ccurpmfc_dac_all_enable_t activate,
                      _ccurpmfc_dac_all_enable_t *current_state)

```

Description: Activate/DeActivate DAC module

```

Input:  void *Handle (Handle pointer)
        _ccurpmfc_dac_all_enable_t activate (activate/deactivate)
        # CCURPMFC_DAC_ALL_DISABLE
        # CCURPMFC_DAC_ALL_ENABLE
        # CCURPMFC_DAC_ALL_RESET (disable followed by enable)
        # CCURPMFC_DAC_ALL_ENABLE_DO_NOT_CHANGE
Output: _ccurpmfc_dac_all_enable_t *current_state (active/deactive)

```

```

        # CCURPMFC_DAC_ALL_DISABLE
        # CCURPMFC_DAC_ALL_ENABLE

```

## 2.2.76 ccurPMFC\_DAC\_Get\_Driver\_Write\_Mode()

This call returns the current driver DAC write mode. When a *write(2)* system call is issued, it is this mode that determines the type of write being performed by the driver.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Get_Driver_Write_Mode (void          *Handle,
                                     _ccurpmfc_driver_DAC_write_mode_t *mode)

Description: Get current DAC write mode that will be selected by the 'write()'
                                                    call

Input:  void          *Handle (Handle pointer)
Output: _ccurpmfc_driver_DAC_write_mode_t *mode (select DAC write mode)
        # CCURPMFC_DAC_PIO_CHANNEL
        # CCURPMFC_DAC_PIO_FIFO

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN        (library not open)
        # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
        # CCURPMFC_LIB_IOCTL_FAILED    (driver ioctl call failed)
        # CCURPMFC_LIB_INVALID_ARG     (invalid argument)
*****/

```

## 2.2.77 ccurPMFC\_DAC\_Get\_Fifo\_Channel\_Select()

This call returns the current Fifo Channel selection mask. Only samples for these selected channels are placed in the FIFO during sample generation. Unlike the ADC Fifo channel select option, this DAC FIFO channel select option also restricts DAC channel register writes to those selected by this option. The advantage for implementing this option for DAC channel registers in addition to DAC FIFO is that the user can perform DMA operations to generate samples on selected channels without affecting the output of those channels that have not been included in the channel selection.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Get_Fifo_Channel_Select(void          *Handle,
                                     _ccurpmfc_dac_channel_mask_t
                                     *dac_fifo_channel_select_mask)

Description: DAC Get Fifo Channel Selection

Input:  void          *Handle (handle pointer)
Output: _ccurpmfc_dac_channel_mask_t *dac_fifo_channel_select_mask
                                               (channel select mask)
        # CCURPMFC_DAC_CHANNEL_MASK_0
        # CCURPMFC_DAC_CHANNEL_MASK_1
        # CCURPMFC_DAC_CHANNEL_MASK_2

# CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (DAC is not active)
*****/

```

## 2.2.78 ccurPMFC\_DAC\_Get\_Fifo\_Info()

This call returns DAC FIFO information to the user.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Get_Fifo_Info (void          *Handle,
                             ccurpmfc_dac_fifo_info_t *dac_fifo)

```

Description: Get DAC FIFO control and Status information

Input: void \*Handle (Handle pointer)  
Output: ccurpmfc\_dac\_fifo\_info\_t \*dac\_fifo (pointer to DAC fifo struct)

```

_ccurpmfc_dac_fifo_reset_t    reset;
# CCURPMFC_DAC_FIFO_ACTIVE

*****/

```

## 2.2.79 ccurPMFC\_DAC\_Get\_Fifo\_Threshold()

This call returns the DAC Fifo threshold information.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_DAC_Get_Fifo_Threshold(void *Handle,
                                  uint *dac_threshold)

Description: DAC Get Fifo Threshold

Input:  void          *Handle      (handle pointer)
Output: uint          *dac_threshold (DAC fifo threshold)
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)

        # CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (DAC is not active)
*****/
```

## 2.2.80 ccurPMFC\_DAC\_Get\_Fifo\_Write\_Count()

This call returns the count of the DAC FIFO. It is updated anytime the FIFO is written to. This is only used for debug.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_DAC_Get_Fifo_Write_Count(void *Handle,
                                     uint *dac_write_count)

Description: DAC Get Fifo Write Count

Input:  void          *Handle      (handle pointer)
Output: uint          *dac_write_count (DAC fifo write count)
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN     (device not open)
        # CCURPMFC_LIB_INVALID_ARG   (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (DAC is not active)
*****/
```

## 2.2.81 ccurPMFC\_DAC\_Get\_Gain\_Cal()

This call returns the DAC calibration gain values.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_DAC_Get_Gain_Cal(void          *Handle,
                             _ccurpmfc_dac_channel_mask_t ChanMask,
                             ccurpmfc_dac_cal_t *cal)

Description: Get the DAC Gain Calibration data.

Input:  void          *Handle      (handle pointer)
        _ccurpmfc_dac_channel_mask_t ChanMask (channel selection mask)
        # CCURPMFC_DAC_CHANNEL_MASK_0
        # CCURPMFC_DAC_CHANNEL_MASK_1
        # CCURPMFC_DAC_CHANNEL_MASK_2
*****/
```

```

# CCURPMFC_DAC_CHANNEL_MASK_3
# CCURPMFC_DAC_CHANNEL_MASK_4
# CCURPMFC_DAC_CHANNEL_MASK_5
# CCURPMFC_DAC_CHANNEL_MASK_6
# CCURPMFC_DAC_CHANNEL_MASK_7
# CCURPMFC_DAC_CHANNEL_MASK_8
# CCURPMFC_DAC_CHANNEL_MASK_9
# CCURPMFC_DAC_CHANNEL_MASK_10
# CCURPMFC_DAC_CHANNEL_MASK_11
# CCURPMFC_DAC_CHANNEL_MASK_12
# CCURPMFC_DAC_CHANNEL_MASK_13
# CCURPMFC_DAC_CHANNEL_MASK_14
# CCURPMFC_DAC_CHANNEL_MASK_15
# CCURPMFC_ALL_DAC_CHANNELS_MASK
Output:  ccurpmfc_dac_cal_t          *cal      (pointer to board cal)
        uint      Raw[CCURPMFC_MAX_DAC_CHANNELS]
        double   Float[CCURPMFC_MAX_DAC_CHANNELS]
        double   CalibrationReferenceVoltage[CCURPMFC_MAX_DAC_CHANNELS]
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)

        # CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (DAC is not active)
*****/

```

## 2.2.82 ccurPMFC\_DAC\_Get\_Offset\_Cal()

This call returns the DAC calibration offset values.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Get_Offset_Cal(void          *Handle,
                                _ccurpmfc_dac_channel_mask_t ChanMask
                                ccurpmfc_dac_cal_t          *cal)

```

Description: Get the DAC Offset Calibration data.

```

Input:  void          *Handle (handle pointer)
        _ccurpmfc_dac_channel_mask_t ChanMask (channel selection mask)
        # CCURPMFC_DAC_CHANNEL_MASK_0
        # CCURPMFC_DAC_CHANNEL_MASK_1
        # CCURPMFC_DAC_CHANNEL_MASK_2
        # CCURPMFC_DAC_CHANNEL_MASK_3
        # CCURPMFC_DAC_CHANNEL_MASK_4
        # CCURPMFC_DAC_CHANNEL_MASK_5
        # CCURPMFC_DAC_CHANNEL_MASK_6
        # CCURPMFC_DAC_CHANNEL_MASK_7
        # CCURPMFC_DAC_CHANNEL_MASK_8
        # CCURPMFC_DAC_CHANNEL_MASK_9
        # CCURPMFC_DAC_CHANNEL_MASK_10
        # CCURPMFC_DAC_CHANNEL_MASK_11
        # CCURPMFC_DAC_CHANNEL_MASK_12
        # CCURPMFC_DAC_CHANNEL_MASK_13
        # CCURPMFC_DAC_CHANNEL_MASK_14
        # CCURPMFC_DAC_CHANNEL_MASK_15
        # CCURPMFC_ALL_DAC_CHANNELS_MASK
Output:  ccurpmfc_dac_cal_t          *cal      (pointer to board cal)
        uint      Raw[CCURPMFC_MAX_DAC_CHANNELS]
        double   Float[CCURPMFC_MAX_DAC_CHANNELS]

```

```

        double CalibrationReferenceVoltage[CCURPMFC_MAX_DAC_CHANNELS]
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)

*****/

```

### 2.2.83 ccurPMFC\_DAC\_Get\_Update\_Source\_Select()

This call allows the user to return the selected DAC update source.

```

/*****
 _ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Get_Update_Source_Select (void           *Handle,
                                       _ccurpmfc_daccsr_update_source_t
                                       *update_source)

```

Description: Get DAC Update Source Select

```

Input:  void           *Handle      (Handle pointer)
Output: _ccurpmfc_daccsr_update_source_t *update_source (pointer to update
                                       source)

```

```

        # CCURPMFC_DAC_UPDATE_SOFTWARE
        # CCURPMFC_DAC_UPDATE_CLOCK_0
        # CCURPMFC_DAC_UPDATE_CLOCK_1
        # CCURPMFC_DAC_UPDATE_CLOCK_2
        # CCURPMFC_DAC_UPDATE_CLOCK_3
        # CCURPMFC_DAC_UPDATE_CLOCK_4
        # CCURPMFC_DAC_UPDATE_CLOCK_5
        # CCURPMFC_DAC_UPDATE_CLOCK_6
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)
        # CCURPMFC_LIB_INVALID_ARG      (invalid argument)

        # CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (DAC is not active)
*****/

```

### 2.2.84 ccurPMFC\_DAC\_Perform\_Auto\_Calibration()

This single call performs a full DAC calibration of all the channels using the ADC. The ADC needs to be first calibrated prior to issuing this call.

```

/*****
 _ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Perform_Auto_Calibration(void           *Handle,
                                       _ccurpmfc_dac_channel_mask_t  ChanMask)

```

Description: Perform DAC Auto Calibration for selected channels

```

Input:  void           *Handle (handle pointer)
        _ccurpmfc_dac_channel_mask_t ChanMask (channel selection mask)
        # CCURPMFC_DAC_CHANNEL_MASK_0
        # CCURPMFC_DAC_CHANNEL_MASK_1
        # CCURPMFC_DAC_CHANNEL_MASK_2
        # CCURPMFC_DAC_CHANNEL_MASK_3
        # CCURPMFC_DAC_CHANNEL_MASK_4

```

```

# CCURPMFC_DAC_CHANNEL_MASK_5

*****/

```

## 2.2.85 ccurPMFC\_DAC\_Perform\_Gain\_Calibration()

This call performs a *gain* calibration using the ADC. The ADC needs to be first calibrated prior to issuing this call.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Perform_Gain_Calibration(void *Handle,
_ccurpmfc_dac_channel_mask_t ChanMask)

```

Description: Perform DAC Gain Calibration for selected channels

Input: void \*Handle (handle pointer)  
\_ccurpmfc\_dac\_channel\_mask\_t ChanMask (channel selection mask)

```

# CCURPMFC_DAC_CHANNEL_MASK_0
# CCURPMFC_DAC_CHANNEL_MASK_1
# CCURPMFC_DAC_CHANNEL_MASK_2
# CCURPMFC_DAC_CHANNEL_MASK_3
# CCURPMFC_DAC_CHANNEL_MASK_4
# CCURPMFC_DAC_CHANNEL_MASK_5
# CCURPMFC_DAC_CHANNEL_MASK_6
# CCURPMFC_DAC_CHANNEL_MASK_7
# CCURPMFC_DAC_CHANNEL_MASK_8
# CCURPMFC_DAC_CHANNEL_MASK_9
# CCURPMFC_DAC_CHANNEL_MASK_10
# CCURPMFC_DAC_CHANNEL_MASK_11
# CCURPMFC_DAC_CHANNEL_MASK_12
# CCURPMFC_DAC_CHANNEL_MASK_13
# CCURPMFC_DAC_CHANNEL_MASK_14
# CCURPMFC_DAC_CHANNEL_MASK_15
# CCURPMFC_ALL_DAC_CHANNELS_MASK

```

Output: none  
Return: \_ccurpmfc\_lib\_error\_number\_t  
# CCURPMFC\_LIB\_NO\_ERROR (successful)  
# CCURPMFC\_LIB\_BAD\_HANDLE (no/bad handler supplied)  
# CCURPMFC\_LIB\_NOT\_OPEN (library not open)  
# CCURPMFC\_LIB\_INVALID\_ARG (invalid argument)

## 2.2.87 ccurPMFC\_DAC\_Read\_Channels\_Calibration()

This routine reads the DAC channel calibration registers and dumps all of them to the user specified file. If the file name specified is NULL, then information is written to *stdout*.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Read_Channels_Calibration(void *Handle,
                                           char *filename)

```

Description: Read DAC Channels Calibration

```
Input:   void   *Handle           (handle pointer)
Output:  char   *filename         (pointer to filename)
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN     (library not open)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_CANNOT_OPEN_FILE (cannot open calib. file)
        # CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (ADC is not active)
```

## 2.2.88 ccurPMFC\_DAC\_ReadBack\_Channels()

This call is more of debug purpose. It causes the DAC channels output to be connected to a user specified ADC channel and then returns the current reading of the ADC channel. Hence, we have read back the DAC channels selected.

If the ADC configuration *adc\_csr* is *NULL*, then the call reads the current ADC configuration for the selected ADC channel *ADCChan*, however, the user can instead supply a pointer to the ADC configuration *adc\_csr* where they have already configured the ADC as the following:

```
adc_data_format = CCURPMFC_ADC_TWOS_COMPLEMENT
adc_input_range = CCURPMFC_ADC_BIPOLAR_10V
adc_input_signal = CCURPMFC_ADC_CALIBRATION_BUS
adc_update_clock = CCURPMFC_ADC_UPDATE_CLOCK_0
```

Note that the *adc\_update\_clock* should be set to the currently active clock. Failure to set the above values will result in the call failing with invalid argument *CCURPMFC\_LIB\_INVALID\_ARG*.

```
/*
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_ReadBack_Channels(void           *Handle,
                                _ccurpmfc_dac_channel_mask_t DACChanMask,
                                _ccurpmfc_adc_channel_t      ADCChan,
                                _ccurpmfc_adc_csr_t           *adc_csr,
                                ccurpmfc_dac_volts_t          *dac_volts)
```

Description: Read Back DAC Channels using ADC

```

## 2.2.89 ccurPMFC\_DAC\_Read\_Channels()

This call provides the user an easy method of reading the DAC channels. User can supply a channel mask. If pointer to *dac\_csr* is NULL, then the routine itself computes the current DAC configuration. For performance, the user should get the current DAC configuration using the *ccurPMFC\_DAC\_CSR()* call to get the current settings and pass it to this routine. Hence, if the configuration is not changed, the user can continuously invoke *ccurPMFC\_DAC\_Read\_Channels()* routine without incurring the additional overhead of routine calling the *ccurPMFC\_DAC\_CSR()* call.

```
/******  
_ccurpmfc_lib_error_number_t  
ccurPMFC_DAC_Read_Channels(void *Handle,  
                             _ccurpmfc_dac_channel_mask_t ChanMask,  
                             _ccurpmfc_dac_csr_t *dac_csr,  
                             ccurpmfc_dac_volts_t *dac_volts)
```

Description: Read DAC Channels

```
Input: void *Handle (Handle pointer)  
       _ccurpmfc_dac_channel_mask_t ChanMask (specify channel mask)  
       # CCURPMFC_DAC_CHANNEL_MASK_0

        # CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (DAC is not active)
*****/
```

## 2.2.93 ccurPMFC\_DAC\_Set\_Driver\_Write\_Mode()

This call sets the current driver write mode. When a *write(2)* system call is issued, it is this mode that determines the type of DAC write being performed by the driver. Refer to the *write(2)* system call under *Direct Driver Access* section for more information on the various modes.

```
/******  
ccurPMFC_DAC_Set_Driver_Write_Mode()  
_ccurpmfc_lib_error_number_t  
ccurPMFC_Select_Driver_DAC_Write_Mode (void          *Handle,  
                                         _ccurpmfc_driver_DAC_write_mode_t  mode)  
  
Description: Select Driver DAC_Write Mode  
  
Input:   void          *Handle (Handle pointer)  
         _ccurpmfc_driver_DAC_write_mode_t mode   (select write mode)  
         # CCURPMFC_DAC_PIO_CHANNEL  
         # CCURPMFC_DAC_PIO_FIFO  
Output:  none  
Return:  _ccurpmfc_lib_error_number_t  
         # CCURPMFC_LIB_NO_ERROR          (successful)  
         # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)  
         # CCURPMFC_LIB_NOT_OPEN         (device not open)  
         # CCURPMFC_LIB_INVALID_ARG      (invalid argument)  
         # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)  
*****/
```

## 2.2.94 ccurPMFC\_DAC\_Set\_Fifo\_Channel\_Select()

This call allows the user to select a set of channels that need to be provided in the DAC FIFO or the DAC channel registers. Only samples for these selected channels are placed in the FIFO during sample generation. Unlike the ADC Fifo channel select option, this DAC FIFO channel select option also restricts DAC channel register writes to those selected by this option. The advantage for implementing this option for DAC channel registers in addition to DAC FIFO is that the user can perform DMA operations to generate samples on selected channels without affecting the output of those channels that have not been included in the channel selection.

```
/******  
_ccurpmfc_lib_error_number_t  
ccurPMFC_DAC_Set_Fifo_Channel_Select(void          *Handle,  
                                         _ccurpmfc_dac_channel_mask_t  
                                         dac_fifo_channel_select_mask)  
  
Description: DAC Set Fifo Channel Selection  
  
Input:   void          *Handle (handle pointer)  
         _ccurpmfc_dac_channel_mask_t  
         dac_fifo_channel_select_mask (channel select mask)

```

### 2.2.95 ccurPMFC\_DAC\_Set\_Fifo\_Threshold()

This call allows the user to set the DAC FIFO threshold.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Set_Fifo_Threshold(void *Handle,
                                uint dac_threshold)

Description: DAC Set Fifo Threshold

Input: void *Handle (handle pointer)
       uint dac_threshold (DAC fifo threshold)
Output: none
Return: _ccurpmfc_lib_error_number_t
# CCURPMFC_LIB_NO_ERROR (successful)
# CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN (device not open)
# CCURPMFC_LIB_INVALID_ARG (invalid argument)
# CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
# CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (DAC is not active)
*****/

```

### 2.2.96 ccurPMFC\_DAC\_Set\_Fifo\_Write\_Count()

This call allows the user the set the DAC FIFO write count. This is only used for debug.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Set_Fifo_Write_Count(void *Handle,
                                   uint dac_write_count)

Description: DAC Set Fifo Write Count

Input: void *Handle (handle pointer)
       uint dac_write_count (DAC fifo write count)
Output: none
Return: _ccurpmfc_lib_error_number_t
# CCURPMFC_LIB_NO_ERROR (successful)
# CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN (device not open)

*****/

```

## 2.2.99 ccurPMFC\_DAC\_Set\_Update\_Source\_Select()

This call allows the user to set the DAC update source. Users can select either one of the defined clock generators or software update to cause the samples in the FIFO to be sent out.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Set_Update_Source_Select (void          *Handle,
                                       _ccurpmfc_daccsr_update_source_t
                                       update_source)

```

Description: Set DAC Update Source Select

```

Input:    void          *Handle          (Handle pointer)
           _ccurpmfc_daccsr_update_source_t
           update_source (pointer to update
                           source)

```

```

# CCURPMFC_DAC_UPDATE_SOFTWARE
# CCURPMFC_DAC_UPDATE_CLOCK_0
# CCURPMFC_DAC_UPDATE_CLOCK_1
# CCURPMFC_DAC_UPDATE_CLOCK_2
# CCURPMFC_DAC_UPDATE_CLOCK_3
# CCURPMFC_DAC_UPDATE_CLOCK_4
# CCURPMFC_DAC_UPDATE_CLOCK_5
# CCURPMFC_DAC_UPDATE_CLOCK_6

```

Output: none

```

Return:    _ccurpmfc_lib_error_number_t
           # CCURPMFC_LIB_NO_ERROR          (successful)
           # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
           # CCURPMFC_LIB_NOT_OPEN        (device not open)
           # CCURPMFC_LIB_INVALID_ARG     (invalid argument)
           # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
           # CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (DAC is not active)
*****/

```

## 2.2.100 ccurPMFC\_DAC\_Wait\_For\_Channel\_Idle()

This call is used when writing to channel registers to ensure that we are not writing too fast. The DAC must be idle prior to the corresponding channel write, otherwise, the data would not be sent out.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_DAC_Wait_For_Channel_Idle (void          *Handle,
                                       _ccurpmfc_dac_channel_t dac_channel)

Description: Wait for DAC Channel to go idle

Input:   void          *Handle          (Handle pointer)
         _ccurpmfc_dac_channel_t      dac_channel    (dac channel number)
         # CCURPMFC_DAC_CHANNEL_0
         # CCURPMFC_DAC_CHANNEL_1
         # CCURPMFC_DAC_CHANNEL_2
         # CCURPMFC_DAC_CHANNEL_3
         # CCURPMFC_DAC_CHANNEL_4
         # CCURPMFC_DAC_CHANNEL_5
         # CCURPMFC_DAC_CHANNEL_6
         # CCURPMFC_DAC_CHANNEL_7
         # CCURPMFC_DAC_CHANNEL_8
         # CCURPMFC_DAC_CHANNEL_9
         # CCURPMFC_DAC_CHANNEL_10
         # CCURPMFC_DAC_CHANNEL_11
         # CCURPMFC_DAC_CHANNEL_12
         # CCURPMFC_DAC_CHANNEL_13
         # CCURPMFC_DAC_CHANNEL_14
         # CCURPMFC_DAC_CHANNEL_15

Output:  none

Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR          (successful)
         # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN         (device not open)
         # CCURPMFC_LIB_IOCTL_FAILED     (driver ioctl call failed)
         # CCURPMFC_LIB_INVALID_ARG      (Invalid argument)
         # CCURPMFC_LIB_DAC_FIFO_UNDERFLOW (DAC Fifo underflow)
         # CCURPMFC_LIB_DAC_IS_BUSY      (DAC is busy)
*****/
```

## 2.2.101 ccurPMFC\_DAC\_Wait\_For\_Fifo\_To\_Drain()

This call is used prior to writing to the DAC fifo to ensure that there is enough sample space available to complete the write without getting an overflow condition. User needs to specify the threshold level to wait for the FIFO to reach, before returning to the caller. Note that if the threshold is too low, it is possible that the FIFO could experience an underflow condition prior to adding more samples to the FIFO.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_DAC_Wait_For_Fifo_To_Drain (void *Handle,
                                       uint  fifo_threshold)

Description: Wait for DAC Fifo to drain

Input:   void          *Handle          (Handle pointer)
         uint          fifo_threshold    (fifo threshold)

Output:  none

Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR          (successful)
         # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
*****/
```

```

# CCURPMFC_LIB_NOT_OPEN          (device not open)
# CCURPMFC_LIB_IOCTL_FAILED      (driver ioctl call
                                  failed)
# CCURPMFC_LIB_INVALID_ARG       (Invalid argument)
# CCURPMFC_LIB_DAC_FIFO_UNDERFLOW (DAC Fifo underflow)
*****/

```

## 2.2.102 ccurPMFC\_DAC\_Write\_Channels()

This call provides the user an easy method of writing the DAC channels. User can supply a channel mask. If pointer to *dac\_csr* is NULL, then the routine itself computes the current DAC configuration. For performance, the user should get the current DAC configuration using the *ccurPMFC\_DAC\_CSR()* call to get the current settings and pass it to this routine. Hence, if the configuration is not changed, the user can continuously invoke *ccurPMFC\_DAC\_Write\_Channels()* routine without incurring the additional overhead of routine calling the *ccurPMFC\_DAC\_CSR()* call.

```

/*****

```

```

_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Write_Channels(void          *Handle,
                                   _ccurpmfc_dac_channel_mask_t ChanMask,
                                   _ccurpmfc_dac_csr_t          *dac_csr,
                                   ccurpmfc_dac_volts_t          *dac_volts)

```

Description: Read DAC Channels

```

Input:  void          *Handle          (Handle pointer)
        _ccurpmfc_dac_channel_mask_t ChanMask      (specify channel mask)
        # CCURPMFC_DAC_CHANNEL_MASK_0
        # CCURPMFC_DAC_CHANNEL_MASK_1
        # CCURPMFC_DAC_CHANNEL_MASK_2
        # CCURPMFC_DAC_CHANNEL_MASK_3

```

### 2.2.103 ccurPMFC\_DAC\_Write\_Channels\_Calibration()

This call allows the user to write the calibration registers from a user supplied calibration file. The format of the file is similar to that generated by the *ccurPMFC\_DAC\_Read\_Channels\_Calibration()* call. File can contain comments if they start with '#', '\*', or empty lines. Additionally, users need only specify those channels that they wish to calibrate and the order of specifying channels in not important, however, the format of each channel entry needs to be adhered to. E.g. <chxx:> <gain> <offset>

```

/*****
ccurPMFC_DAC_Write_Channels_Calibration()

Description: Write Channels Calibration

Input: void *Handle (handle pointer)
Output: char *filename (pointer to filename)
Return: _ccurpmfc_lib_error_number_t
# CCURPMFC_LIB_NO_ERROR (successful)
# CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN (library not open)
# CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
# CCURPMFC_LIB_CANNOT_OPEN_FILE (cannot open calib. file)
# CCURPMFC_LIB_INVALID_ARG (invalid argument)
# CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (DAC is not active)
*****/

```

e.g.

```

### 2.2.104 ccurPMFC\_DataToVolts()

This routine takes a raw analog input data value and converts it to a floating point voltage based on the supplied format. Format can be *CCURPMFC\_TWOS\_COMPLEMENT* or *CCURPMFC\_OFFSET\_BINARY*. The data supplied in *us\_data* must not be greater than the hardware resolution bits *CCURPMFC\_ADC\_RESOLUTION\_BITS* supported by the board. Data greater than this will be masked out.

```

/*****
double ccurPMFC_DataToVolts(int us_data, ccurpmfc_volt_convert_t *conv)

Description: Convert Data to volts

Input:  int          us_data          (data to convert)
        ccurpmfc_volt_convert_t      *conv      (pointer to
                                                conversion struct)

### 2.2.105 ccurPMFC\_Destroy\_AllUserProcess()

The purpose of this call is to destroy all User Processes that have been previously created by the *ccurPMFC\_Create\_UserProcess()* command. *(This is an experimental API for debugging and testing).*

```

/*****
_ccurpmfc_lib_error_number_t ccurPMFC_Destroy_AllUserProcess(void *Handle)

Description: Destroy all created user processes

Input:  void          *Handle      (Handle pointer)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
*****/

```

### 2.2.106 ccurPMFC\_Destroy\_UserDioCosInterruptHandler()

The purpose of this call is to destroy the User DIO COS Interrupt handler that was created earlier with the *ccurPMFC\_Create\_UserDioCosInterruptHandler()* call.

```

/*****

```

```

_ccurpmfc_lib_error_number_t
ccurPMFC_Destroy_UserDioCosInterruptHandler(void *Handle)

```

Description: Destroy a previously created User DIO COS Interrupt Handler

```

Input:  void *Handle (Handle pointer)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR (successful)
        # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN (device not open)
        # CCURPMFC_LIB_IOCTL_FAILED (ioctl failed)
        # CCURPMFC_LIB_IO_ERROR (failed to terminate handler)

```

\*\*\*\*\*/

### 2.2.107 ccurPMFC\_Destroy\_UserProcess()

The purpose of this call is to destroy the User Process that have been previously created by the *ccurPMFC\_Create\_UserProcess()* call. (This is an experimental API for debugging and testing).

```

/*****
_ccurpmfc_lib_error_number_t ccurPMFC_Destroy_UserProcess(void *Handle,
        _ccurpmfc_UserFunction_t **UFuncHandle)

```

Description: Destroy an already created user process

```

Input:  void *Handle (Handle pointer)
        _ccurpmfc_UserFunction_t **UFuncHandle (pointer to user handle)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR (successful)
        # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)

```

\*\*\*\*\*/

### 2.2.108 ccurPMFC\_DIO\_Activate()

This call must be the first call to activate the DIO. Without activation, all other calls to the DIO will fail. The user can also use this call to return the current state of the DIO without any change by specifying a pointer to *current\_state* and setting *activate* to *CCURPMFC\_DIO\_ALL\_ENABLE\_DO\_NOT\_CHANGE*. If the DIO is already active and the user issues a *CCURPMFC\_DIO\_ALL\_ENABLE*, no additional activation will be performed. To cause the DIO to go through a full reset, the user needs to issue the *CCURPMFC\_DIO\_ALL\_RESET* which will cause the DIO to disable and then re-enable, setting all its DIO values to a default state.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Activate (void *Handle,
        _ccurpmfc_dio_all_enable_t activate,
        _ccurpmfc_dio_all_enable_t *current_state)

```

Description: Activate/DeActivate DIO module

```

Input:  void *Handle (Handle pointer)
        _ccurpmfc_dio_all_enable_t activate (activate/deactivate)
        # CCURPMFC_DIO_ALL_DISABLE
        # CCURPMFC_DIO_ALL_ENABLE (disable followed by enable)
        # CCURPMFC_DIO_ALL_RESET
        # CCURPMFC_DIO_ALL_ENABLE_DO_NOT_CHANGE
Output: _ccurpmfc_dio_all_enable_t *current_state (active/deactive)
        # CCURPMFC_DIO_ALL_DISABLE

```

```

Return:      # CCURPMFC_DIO_ALL_ENABLE
             _ccurpmfc_lib_error_number_t
             # CCURPMFC_LIB_NO_ERROR                (successful)
             # CCURPMFC_LIB_BAD_HANDLE             (no/bad handler supplied)
             # CCURPMFC_LIB_NOT_OPEN              (device not open)
             # CCURPMFC_LIB_INVALID_ARG          (invalid argument)
             # CCURPMFC_LIB_NO_LOCAL_REGION       (local region not present)
/*****/

```

## 2.2.109 ccurPMFC\_DIO\_Get\_Channels\_Polarity()

This call allows the user to get the polarity for the DIO channels. The *ChannelSelectMask* is used to retrieve polarity settings for selected channels.

For input channels, a value of *CCURPMFC\_DIO\_INPUT\_LOW\_TRUE* or '0' for polarity indicates low true, while a value of *CCURPMFC\_DIO\_INPUT\_HIGH\_TRUE* or '1' for polarity indicates high true.

For output channels, a value of *CCURPMFC\_DIO\_OUTPUT\_LOW* or '0' for polarity indicates low or 0 volts, while a value of *CCURPMFC\_DIO\_OUTPUT\_HIGH* or '1' for polarity indicates high or +5 volts.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Get_Channels_Polarity(void          *Handle,
                                     ccurpmfc_dio_channels_t  DIO_ChannelsPolarity,
                                     ccurpmfc_dio_channels_t  ChannelSelectMask)

```

Description: Get Channels Polarity

```

Input:      void          *Handle          (handle pointer)
            ccurpmfc_dio_channels_t  ChannelSelectMask (channel selection)
            # NULL          (select all channels)

## 2.2.110 ccurPMFC\_DIO\_Get\_COS\_Channels\_Edge\_Sense()

This call returns to the user the settings for the change-of-state to sense the rising or falling edge of the signal on input for all the channels. The *ChannelSelectMask* is used to retrieve edge sense settings for selected

channels. A value of *CCURPMFC\_DIO\_COS\_FALLING\_EDGE* or '0' represents sensing of falling edge of input signal while a value of *CCURPMFC\_DIO\_COS\_RISING\_EDGE* or '1' represents sensing of rising edge of input signal.

```

/*****

```

## 2.2.112 ccurPMFC\_DIO\_Get\_COS\_Channels\_Mode()

This call returns to the user the settings for the change-of-state mode registers all the channels. The *ChannelSelectMask* is used to retrieve mode settings for selected channels. A value of *CCURPMFC\_DIO\_COS\_ANY\_TRANSITION* or '0' detects change-of-state on any edge transition while a value of *CCURPMFC\_DIO\_COS\_RISING\_OR\_FALLING\_TRANSITION* or '1' represents enabling change-of-state for either rising edge or falling edge depending on the channel edge sense setting for the selected channels.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Get_COS_Channels_Mode(void          *Handle,
                                     ccurpmfc_dio_channels_t DIO_COS_ChannelsMode,
                                     ccurpmfc_dio_channels_t ChannelSelectMask)

```

### 2.2.113 ccurPMFC\_DIO\_Get\_COS\_Channels\_Overflow()

This call returns to the user the state of the change-of-state overflow registers for all the channels. The *ChannelSelectMask* is used to retrieve overflow settings for selected channels. A value of *CCURPMFC\_DIO\_COS\_OVERFLOW\_DID\_NOT\_OCCUR* or '0' indicates that no overflow occurred while a value of *CCURPMFC\_DIO\_COS\_OVERFLOW\_OCCURRED* or '1' indicates that an overflow condition occurred for the selected channels. An overflow condition is set when a change-of-state condition is detected on a channel that previously detected a change-of-state condition without its status being cleared.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Get_COS_Channels_Overflow(void      *Handle,
                                         ccurpmfc_dio_channels_t DIO_COS_ChannelsOverflow,

## 2.2.114 ccurPMFC\_DIO\_Get\_COS\_Channels\_Status()

This call returns to the user the state of the change-of-state status registers for all the channels. The *ChannelSelectMask* is used to retrieve status settings for selected channels. A value of *CCURPMFC\_DIO\_COS\_DID\_NOT\_OCCUR* or '0' indicates that no change-of-state occurred while a value of *CCURPMFC\_DIO\_COS\_OCCURRED* or '1' indicates that a change-of-state condition occurred for the

selected channels. A change-of-state status is set when the hardware is enabled to detect a change of input signal transition and an input signal is received with the monitored transition.

```

### 2.2.115 ccurPMFC\_DIO\_Get\_Input\_Channels\_Filter()

This call allows the user to get the settings for the DIO channels input filters. The *ChannelSelectMask* is used to retrieve filter settings for selected channels. A value of *CCURPMFC\_DIO\_INPUT\_FILTER\_ENABLED* or '0' for filter indicates that the 100 nanosecond filter is enabled for the selected channel, while a value of *CCURPMFC\_DIO\_INPUT\_FILTER\_DISABLED* or '1' indicates that the filter is disabled. On powerup, filter for all channels are enabled.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Get_Input_Channels_Filter(void          *Handle,

# CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
# CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
*****/

```

## 2.2.116 ccurPMFC\_DIO\_Get\_Input\_Snapshot()

This call returns the Input Snapshot state to the user. The purpose of this snapshot feature is to allow the user to read the input channels without the firmware updating them in the middle of the reads. In this way, then can ensure that all channels data are in sync.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Get_Input_Snapshot(void          *Handle,
                                   _ccurpmfc_dio_input_snapshot_t *dio_snapshot)

Description: Get DIO Input Snapshot

Input:   void          *Handle          (handle pointer)
Output:  _ccurpmfc_dio_input_snapshot_t *dio_snapshot    (dio snapshot)
        # CCURPMFC_DIO_INPUT_OPERATION_CONTINUOUS
        # CCURPMFC_DIO_INPUT_OPERATION_SNAPSHOT

Return:  _ccurpmfc_lib_error_number_t
# CCURPMFC_LIB_NO_ERROR           (successful)
# CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN         (device not open)
# CCURPMFC_LIB_INVALID_ARG      (invalid argument)
# CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
# CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
*****/

```

## 2.2.117 ccurPMFC\_DIO\_Get\_Mode()

This call returns the current DIO mode.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Get_Mode(void          *Handle,
                           _ccurpmfc_dio_mode_t *dio_mode)

Description: Get DIO Mode

Input:   void          *Handle          (handle pointer)

```

```

Output:  _ccurpmfc_dio_mode_t          *dio_mode          (dio mode)
         # CCURPMFC_DIO_MODE_CUSTOM
         # CCURPMFC_DIO_MODE_NORMAL
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR          (successful)
         # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN         (device not open)
         # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
         # CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
*****/

```

## 2.2.118 ccurPMFC\_DIO\_Get\_Output\_Sync()

This call returns the current state of the output sync flag. The purpose of the output sync feature is to ensure that the user can safely program all the output channels prior to directing the firmware to send them out simultaneously.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Get_Output_Sync(void          *Handle,
                                   _ccurpmfc_dio_output_sync_t *dio_sync)

```

Description: Get DIO Output Sync

```

Input:  void          *Handle          (handle pointer)
Output: _ccurpmfc_dio_output_sync_t   *dio_sync          (dio sync)
         # CCURPMFC_DIO_OUTPUT_OPERATION_CONTINUOUS
         # CCURPMFC_DIO_OUTPUT_OPERATION_SYNC
Return: _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR          (successful)
         # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN         (device not open)
         # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
         # CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
*****/

```

## 2.2.119 ccurPMFC\_DIO\_Get\_Ports\_Direction()

This call allows the user to get the direction of the digital channels. There are 24 ports with grouping of 4 channels per port. Direction control is on a port level or a group of 4 channels.

When the direction for channels are set to output, then reading the channels input registers will result in acquiring what was written to the output (loopback). When the direction for the channels are set as inputs, then reading the channels input registers will result in acquiring signals coming into the board from the external digital lines.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Get_Ports_Direction(void          *Handle,
                                   _ccurpmfc_dio_port_mask_t *dio_direction)

```

Description: Get DIO Ports Direction Mask

```

Input:  void          *Handle          (handle pointer)
Output: _ccurpmfc_dio_port_mask_t   *dio_direction       (port mask)
         # CCURPMFC_DIO_PORT_MASK_P0
         # CCURPMFC_DIO_PORT_MASK_P1
         # CCURPMFC_DIO_PORT_MASK_P2
         # CCURPMFC_DIO_PORT_MASK_P3

```

```

Return:  _ccurpmfc_lib_error_number_t
# CCURPMFC_LIB_NO_ERROR           (successful)
# CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN          (device not open)
# CCURPMFC_LIB_INVALID_ARG       (invalid argument)
# CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
# CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
*****/

```

## 2.2.120 ccurPMFC\_DIO\_Read\_Custom\_Channel\_Registers()

This call allows the user to display any DIO channels that have been reserved for custom usage. This is specifically dependant of the firmware being loaded. The user must enable the custom mode for DIO operation before reviewing these reserved channels. If no channels are listed, then no custom DIO channels exist. Any custom DIO channel will not operate in the normal DIO functionality but will behave differently based on the firmware loaded.

```

/*****
ccurPMFC_DIO_Read_Custom_Channel_Registers()
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Read_Custom_Channel_Registers(void          *Handle,
                                                ccurpmfc_dio_channels_t  DIO_CustomChannels,
                                                ccurpmfc_dio_channels_t  ChannelSelectMask)

```

Description: Read DIO Custom Channel Registers

```

Input:  void          *Handle          (handle pointer)
        ccurpmfc_dio_channels_t  ChannelSelectMask (custom channel selection)
        # NULL              (select all channels)

## 2.2.121 ccurPMFC\_DIO\_Read\_Input\_Channel\_Registers()

This call reads the contents of the input channel registers and returns to the user. There are two modes of operation for this call. (1) Continuous (2) Snapshot.

When the user selects the *continuous* operation, this call immediately returns to the user whatever is available on the input registers as they are being received by the hardware. There is therefore no synchronizing occurring between the three input channel registers (32 channels/register). For performance improvements with this operational mode, it is recommended that the user sets the continuous option using the *ccurPMFC\_DIO\_Set\_Input\_Snapshot()* call once and then supply *CCURPMFC\_DIO\_INPUT\_OPERATION\_DO\_NOT\_CHANGE* to this call for more reads. In this way, an additional register access will not occur everytime this call is issued.

When the user selects the *snapshot* operation, there is no need to issue the *ccurPMFC\_DIO\_Set\_Input\_Snapshot()*. All that is required is to supply the *CCURPMFC\_DIO\_INPUT\_OPERATION\_SNAPSHOT* option when issuing this call. The result is that all the three input registers will be captured instantaneously (in sync) by the firmware and returned to the user.

Obviously, the *snapshot* option is only meaningful if the user selects channels (*using the channel selection mask*) that reside in at least two different input channel registers.

```

Input channel register 0: Channels 0 to 31
Input channel register 1: Channels 32 to 63
Input channel register 2: Channels 64 to 95

```

The *skip\_dio\_disable\_check* (when set to *CCURPMFC\_FALSE*) causes the call to test for DIO being enabled prior to proceeding. If this option is set to *CCURPMFC\_TRUE*, then no test is. If the DIO has not been enabled, input reads will be invalid. The only reason for providing the option to disable the check is to improve the performance of the call. If the user can ensure that the DIO is enabled prior to issuing this call, they can set this option to *CCURPMFC\_TRUE* so that no test is performed and hence, improve performance.

When the direction for channels are set to output, then reading the channels input registers will result in acquiring what was written to the output (loopback). When the direction for the channels are set as inputs, then reading the channels input registers will result in acquiring signals coming into the board from the external digital lines.

```

### 2.2.123 ccurPMFC\_DIO\_Set\_Channels\_Polarity()

This call allows the user to set the polarity for the DIO channels. The *ChannelSelectMask* is used to retrieve polarity settings for selected channels.

For input channels, a value of *CCURPMFC\_DIO\_INPUT\_LOW\_TRUE* or '0' for polarity indicates low true, while a value of *CCURPMFC\_DIO\_INPUT\_HIGH\_TRUE* or '1' for polarity indicates high true.

For output channels, a value of *CCURPMFC\_DIO\_OUTPUT\_LOW* or '0' for polarity indicates low or 0 volts, while a value of *CCURPMFC\_DIO\_OUTPUT\_HIGH* or '1' for polarity indicates high or +5 volts.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Set_Channels_Polarity(void *Handle,
                                     ccurpmfc_dio_channels_t DIO_ChannelsPolarity,
                                     ccurpmfc_dio_channels_t ChannelSelectMask)

```

Description: Set Input Channel Filters

```

## 2.2.124 ccurPMFC\_DIO\_Set\_COS\_Channels\_Edge\_Sense()

This call sets the change-of-state to sense the rising or falling edge of the signal on input for the channels. The *ChannelSelectMask* is used to set the edge sense settings for selected channels. A value of *CCURPMFC\_DIO\_COS\_FALLING\_EDGE* or '0' represents sensing of falling edge of input signal while a value of *CCURPMFC\_DIO\_COS\_RISING\_EDGE* or '1' represents sensing of rising edge of input signal.

For edge sensing to occur, the *CCURPMFC\_DIO\_COS\_RISING\_OR\_FALLING\_TRANSITION* bit needs to be set for the corresponding channels using the *ccurPMFC\_DIO\_Set\_COS\_Channels\_Mode()* call.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Set_COS_Channels_Edge_Sense(void      *Handle,
                                           ccurpmfc_dio_channels_t DIO_COS_ChannelsEdgeSense,
                                           ccurpmfc_dio_channels_t ChannelSelectMask)

```

Description: Set COS Channels Edge Sense

## 2.2.125 ccurPMFC\_DIO\_Set\_COS\_Channels\_Enable()

If the user wishes to monitor change-of-state for a channel, then need to enable the change-of-state detection for the respective channels using this call. Without the channel being enabled, no change-of-state detection will occur. The *ChannelSelectMask* is used to set enable settings for selected channels. A value of *CCURPMFC\_DIO\_COS\_IGNORE* or '0' ignores change-of-state while a value of *CCURPMFC\_DIO\_COS\_ENABLE* or '1' represents enabling change-of-state for the selected channels.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Set_COS_Channels_Enable(void          *Handle,
                                     ccurpmfc_dio_channels_t  DIO_COS_ChannelsEnable,
                                     ccurpmfc_dio_channels_t  ChannelSelectMask)

```

Description: Set COS Channels Enable

```

## 2.2.126 ccurPMFC\_DIO\_Set\_COS\_Channels\_Mode()

This call sets the change-of-state mode registers all the channels. The *ChannelSelectMask* is used to set the mode settings for selected channels. A value of *CCURPMFC\_DIO\_COS\_ANY\_TRANSITION* or '0' sets change-of-state on any edge transition while a value of *CCURPMFC\_DIO\_COS\_RISING\_OR\_FALLING\_TRANSITION* or '1' represents enabling change-of-state for either rising edge or falling edge depending on the channel edge sense setting for the selected channels.

```

## 2.2.127 ccurPMFC\_DIO\_Set\_Input\_Channels\_Filter()

This call allows the user to set or reset filters for a selected set of input channels. The *ChannelSelectMask* is used to select channels for filter settings. A value of *CCURPMFC\_DIO\_INPUT\_FILTER\_ENABLED* or '0' for filter indicates that the 100 nanosecond filter is enabled for the selected channel, while a value of *CCURPMFC\_DIO\_INPUT\_FILTER\_DISABLED* or '1' indicates that the filter is disabled. On powerup, filter for all channels are enabled.

```

## 2.2.128 ccurPMFC\_DIO\_Set\_Input\_Snapshot()

This call allows the user to set the board in snapshot mode where all three input registers are acquired simultaneously (in sync) by the hardware and presented to the user. Mainly, this particular call is only useful for setting the operation to continuous mode. There is no need to set to snapshot mode as the read input registers call *ccurPMFC\_DIO\_Read\_Input\_Channel\_Registers()* an option to set it call.

If the user wants to collect data in the continuous mode, then they should issue this call once with the *CCURPMFC\_DIO\_INPUT\_OPERATION\_CONTINUOUS* option and then call the read of the input channels with the *CCURPMFC\_DO\_NOT\_CHANGE* option. In this way, there is no un-necessary overhead in setting the board into continuous mode once it has already been set.

Recommended procedure for continuous mode is to issue this call only once with the *CCURPMFC\_DIO\_INPUT\_OPERATION\_CONTINUOUS* option and then followup with continuous input channel reads using the *ccurPMFC\_DIO\_Read\_Input\_Channel\_Register()* call with the *CCURPMFC\_DIO\_INPUT\_OPERATION\_DO\_NOT\_CHANGE* option for *dio\_snapshot*.

Recommended procedure for snapshot mode is to issue continuous input channel reads using the *ccurPMFC\_DIO\_Read\_Input\_Channel\_Register()* call with the *CCURPMFC\_DIO\_INPUT\_OPERATION\_SYNC* option for *dio\_snapshot*. There is really no need to issue this call.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Set_Input_Snapshot(void          *Handle,
                                   _ccurpmfc_dio_input_snapshot_t dio_snapshot)

Description: Set DIO Input Snapshot

Input:  void          *Handle          (handle pointer)
Output: _ccurpmfc_dio_input_snapshot_t dio_snapshot (dio snapshot)
        # CCURPMFC_DIO_INPUT_OPERATION_CONTINUOUS
        # CCURPMFC_DIO_INPUT_OPERATION_SNAPSHOT
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE      (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN       (device not open)
        # CCURPMFC_LIB_INVALID_ARG    (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
*****/

```

## 2.2.129 ccurPMFC\_DIO\_Set\_Mode()

This call allows the user to select a custom or a normal mode of DIO operation. In the normal mode, all 96 channels are available for DIO operation, while, in the custom mode, the custom channels supplied in the custom input registers may not operate as normal DIO channels. These custom channels behavior will depend entirely on the firmware loaded into the board.

```

/*****
_ccurpmfc_lib_error_number_t

```

```
ccurPMFC_DIO_Set_Mode(void          *Handle,
                      _ccurpmfc_dio_mode_t dio_mode)
```

Description: Set DIO Mode

```
Input:  void          *Handle          (handle pointer)
Output: _ccurpmfc_dio_mode_t  dio_mode (dio mode)
        # CCURPMFC_DIO_MODE_CUSTOM
        # CCURPMFC_DIO_MODE_NORMAL
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN        (device not open)
        # CCURPMFC_LIB_INVALID_ARG     (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
```

\*\*\*\*\*/

### 2.2.130 ccurPMFC\_DIO\_Set\_Output\_Sync()

This call allows the user to set the digital output channels to either *continuous* mode or *sync* mode. When the board is in continuous mode, any update to one of the three output registers will be immediately sent to the output lines. There will be no synchronization between the three output registers. When the sync mode is selected, no output is sent while updating the output registers. Once the output sync flag is set, the contents of all three output registers will be sent simultaneously to the output lines.

Recommended procedure for continuous mode is to issue this call only once with the *CCURPMFC\_DIO\_OUTPUT\_OPERATION\_CONTINUOUS* option and then followup with continuous output channel writes using the *ccurPMFC\_DIO\_Write\_Output\_Channel\_Register()* call with the *CCURPMFC\_DIO\_INPUT\_OPERATION\_DO\_NOT\_CHANGE* option for *dio\_sync*.

Recommended procedure for sync mode is to issue this call only once with the *CCURPMFC\_DIO\_OUTPUT\_OPERATION\_SYNC* option and then followed up with continuous output channel writes using the *ccurPMFC\_DIO\_Write\_Output\_Channel\_Register()* call with the *CCURPMFC\_DIO\_OUTPUT\_OPERATION\_SYNC* option for *dio\_sync*.

\*\*\*\*\*/

```
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Set_Output_Sync(void          *Handle,
                                _ccurpmfc_dio_output_sync_t  dio_sync)
```

Description: Set DIO Output Sync

```
Input:  void          *Handle          (handle pointer)
        _ccurpmfc_dio_output_sync_t  dio_sync (dio sync)
        # CCURPMFC_DIO_OUTPUT_OPERATION_CONTINUOUS
        # CCURPMFC_DIO_OUTPUT_OPERATION_SYNC
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN        (device not open)
        # CCURPMFC_LIB_INVALID_ARG     (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
```

\*\*\*\*\*/

### 2.2.131 ccurPMFC\_DIO\_Set\_Ports\_Direction()

This call allows the user to set the direction of the digital channels. There are 24 ports with grouping of 4 channels per port. Direction control is on a port level or a group of 4 channels.

When the direction for channels are set to output, then reading the channels input registers will result in acquiring what was written to the output (readback). When the direction for the channels are set as inputs, then reading the channels input registers will result in acquiring signals coming into the board from the external digital lines.

```
/******  
_ccurpmfc_lib_error_number_t  
ccurPMFC_DIO_Set_Ports_Direction(void *Handle,  
_ccurpmfc_dio_port_mask_t dio_direction)
```

Description: Set DIO Port Direction Mask

Input: void \*Handle (handle pointer)  
\_ccurpmfc\_dio\_port\_mask\_t dio\_direction (port mask)

```
# CCURPMFC_DIO_PORT_MASK_P0  
# CCURPMFC_DIO_PORT_MASK_P1

## 2.2.134 ccurPMFC\_DIO\_Write\_Output\_Channel\_Registers()

This call writes the user supplied channel settings to the output channel registers. There are two modes of operation for this call. (1) Continuous (2) Sync.

When the user selects the *continuous* operation, this call immediately sends out the channel data to the output lines as they are written to the output registers. There is therefore no synchronizing occurring between the three output channel registers (32 channels/register). For performance improvements with this operational mode, it is recommended that the user sets the continuous option using the *ccurPMFC\_DIO\_Set\_Output\_Sync()* call once and then supply *CCURPMFC\_DIO\_INPUT\_OPERATION\_DO\_NOT\_CHANGE* to this call for more writes. In this way, an additional register access will not occur everytime this call is issued.

When the user selects the *sync* operation, they need to issue the *ccurPMFC\_DIO\_Set\_Output\_Sync()* call once with the *CCURPMFC\_DIO\_OUTPUT\_OPERATION\_SYNC* option, followed by issuing this call with the *CCURPMFC\_DIO\_OUTPUT\_OPERATION\_SYNC* option in *dio\_sync*.

Obviously, the *sync* option is only meaningful if the user selects channels (*using the channel selection mask*) that reside in at least two different output channel registers.

Output channel register 0: Channels 0 to 31

Output channel register 1: Channels 32 to 63

Output channel register 2: Channels 64 to 95

The *skip\_dio\_disable\_check* (when set to *CCURPMFC\_FALSE*) causes the call to test for DIO being enabled prior to proceeding. If this option is set to *CCURPMFC\_TRUE*, then no test is. If the DIO has not been enabled, output writes will not take place. The only reason for providing the option to disable the check is to improve the performance of the call. If the user can ensure that the DIO is enabled prior to issuing this call, they can set this option to *CCURPMFC\_TRUE* so that no test is performed and hence, improve performance.

## 2.2.135 `ccurPMFC_DIO_Write_Output_Channel_High_Registers()`

This call writes a selected set of channels to high outputs. Rest of the channels is not affected. There are two modes of operation for this call. (1) Continuous (2) Sync.

When the user selects the *continuous* operation, this call immediately sends out the channel high data to the output lines as they are written to the output registers. There is therefore no synchronizing occurring between the three output channel registers (32 channels/register). For performance improvements with this operational mode, it is recommended that the user sets the continuous option using the `ccurPMFC_DIO_Set_Output_Sync()` call once and then supply `CCURPMFC_DIO_INPUT_OPERATION_DO_NOT_CHANGE` to this call for more writes. In this way, an additional register access will not occur everytime this call is issued.

When the user selects the *sync* operation, they need to issue the `ccurPMFC_DIO_Set_Output_Sync()` call once with the `CCURPMFC_DIO_OUTPUT_OPERATION_SYNC` option, followed by issuing this call with the `CCURPMFC_DIO_OUTPUT_OPERATION_SYNC` option in `dio_sync`.

Obviously, the *sync* option is only meaningful if the user selects channels (*sets channels for high*) that reside in at least two different output channel registers.

Output channel register 0: Channels 0 to 31  
 Output channel register 1: Channels 32 to 63  
 Output channel register 2: Channels 64 to 95

The `skip_dio_disable_check` (when set to `CCURPMFC_FALSE`) causes the call to test for DIO being enabled prior to proceeding. If this option is set to `CCURPMFC_TRUE`, then no test is. If the DIO has not been enabled, output writes will not take place. The only reason for providing the option to disable the check is to improve the performance of the call. If the user can ensure that the DIO is enabled prior to issuing this call, they can set this option to `CCURPMFC_TRUE` so that no test is performed and hence, improve performance.

## 2.2.136 ccurPMFC\_DIO\_Write\_Output\_Channel\_Low\_Registers()

This call writes a selected set of channels to low outputs. Rest of the channels is not affected. There are two modes of operation for this call. (1) Continuous (2) Sync.

When the user selects the *continuous* operation, this call immediately sends out the channel low data to the output lines as they are written to the output registers. There is therefore no synchronizing occurring between the three output channel registers (32 channels/register). For performance improvements with this operational mode, it is recommended that the user sets the continuous option using the *ccurPMFC\_DIO\_Set\_Output\_Sync()* call once and then supply *CCURPMFC\_DIO\_INPUT\_OPERATION\_DO\_NOT\_CHANGE* to this call for more writes. In this way, an additional register access will not occur everytime this call is issued.

When the user selects the *sync* operation, they need to issue the *ccurPMFC\_DIO\_Set\_Output\_Sync()* call once with the *CCURPMFC\_DIO\_OUTPUT\_OPERATION\_SYNC* option, followed by issuing this call with the *CCURPMFC\_DIO\_OUTPUT\_OPERATION\_SYNC* option in *dio\_sync*.

Obviously, the *sync* option is only meaningful if the user selects channels (*sets channels for low*) that reside in at least two different output channel registers.

```

Output channel register 0: Channels 0 to 31
Output channel register 1: Channels 32 to 63
Output channel register 2: Channels 64 to 95

```

The *skip\_dio\_disable\_check* (when set to *CCURPMFC\_FALSE*) causes the call to test for DIO being enabled prior to proceeding. If this option is set to *CCURPMFC\_TRUE*, then no test is. If the DIO has not been enabled, output writes will not take place. The only reason for providing the option to disable the check is to

improve the performance of the call. If the user can ensure that the DIO is enabled prior to issuing this call, they can set this option to *CCURPMFC\_TRUE* so that no test is performed and hence, improve performance.

```

*****/

```

## 2.2.140 ccurPMFC\_Enable\_Pci\_Interrupts()

The purpose of this call is to enable PCI interrupts. This call shouldn't be used during normal reads as calls could time out. The driver handles enabling and disabling interrupts during its normal course of operation.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Enable_Pci_Interrupts (void          *Handle,
                                _ccurpmfc_all_interrupts_mask interrupt_mask)

```

Description: Enable interrupts being generated by the board.

```
Input:  void                *Handle          (Handle pointer)
        _ccurpmfc_all_interrupts_mask interrupt_mask (interrupt mask)
        # CCURPMFC_DMA0_INTMASK
        # CCURPMFC_DMA1_INTMASK
        # CCURPMFC_MSGDMA_INTMASK
        # CCURPMFC_ADC_FIFO_INTMASK
        # CCURPMFC_DAC_FIFO_INTMASK
        # CCURPMFC_DIO_GROUP0_INTMASK
        # CCURPMFC_DIO_GROUP1_INTMASK
        # CCURPMFC_DIO_GROUP2_INTMASK
        # CCURPMFC_ALL_DMA_INTMASK
        # CCURPMFC_ALL_ANALOG_INTMASK
        # CCURPMFC_ALL_DIO_INTMASK
        # CCURPMFC_DMA_ANALOG_INTMASK
        # CCURPMFC_ALL_INTMASK

Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN     (device not open)
        # CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)
*****/
```

### 2.2.141 ccurPMFC\_Fast\_Memcpy()

The purpose of this call is to provide a fast mechanism to copy between hardware and memory using programmed I/O. The library performs appropriate locking while the copying is taking place. If the board provides support for double word transfers, this call will utilize it.

```
/******
ccurPMFC_Fast_Memcpy(void          *Handle,
                    volatile void *Destination,
                    volatile void *Source,
                    int            SizeInBytes)
```

Description: Perform fast copy to/from buffer using Programmed I/O  
(WITH LOCKING)

```
Input:  void          *Handle          (Handle pointer)
        volatile void *Source          (pointer to source buffer)
        int           SizeInBytes      (transfer size in bytes)
Output: volatile void *Destination     (pointer to destination buffer)
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN     (device not open)
*****/
```

### 2.2.142 ccurPMFC\_Fast\_Memcpy\_Unlocked()

The purpose of this call is to provide a fast mechanism to copy between hardware and memory using programmed I/O. The library does not perform any locking. User needs to provide external locking instead. If the board provides support for double word transfers, this call will utilize it. The *double\_word\_support* field in the driver information structure *ccurpmfc\_driver\_info\_t* indicates whether the double word support is available in the hardware.

```
/******
void
```

```

ccurPMFC_Fast_Memcpy_Unlocked(volatile void *Destination,
                               volatile void *Source,
                               int          SizeInBytes
                               int          DoubleWordSupport)

```

Description: Perform fast copy to/from buffer using Programmed I/O  
(WITHOUT LOCKING)

```

Input:  volatile void *Source          (pointer to source buffer)
        int          SizeInBytes      (transfer size in bytes)
        int          DoubleWordSupport (double word support flag)
        # CCURPMFC_FALSE              (h/w double word transfers not
                                       supported)
        # CCURPMFC_TRUE               (h/w double word transfers
                                       supported)

Output: volatile void *Destination    (pointer to destination buffer)
Return: none

```

\*\*\*\*\*/

### 2.2.143 ccurPMFC\_Fast\_Memcpy\_Unlocked\_FIFO()

The purpose of this call is to provide a simple mechanism to copy between hardware FIFO and memory using programmed I/O. The library does not perform any locking. User needs to provide external locking instead. If the board provides support for double word transfers, this call will utilize it. The *double\_word\_support* field in the driver information structure *ccurpmfc\_driver\_info\_t* indicates whether the double word support is available in the hardware.

\*\*\*\*\*/

```

void
ccurPMFC_Fast_Memcpy_Unlocked_FIFO(volatile void *Destination,
                                    volatile void *Source,
                                    int          SizeInWords,
                                    int          PioControl,
                                    int          DoubleWordSupport)

```

Description: Perform fast copy to/from FIFO buffer using Programmed I/O  
(WITHOUT LOCKING)

```

Input:  volatile void *Source          (pointer to source buffer)
        int          SizeInWords      (transfer size in words)
        int          PioControl        (PIO Control)
        # CCURPMFC_PIO_CONTROL_RCON   (read constant)
        # CCURPMFC_PIO_CONTROL_WCON   (write constant)
        # CCURPMFC_PIO_CONTROL_INCREMENT (read/write increment)
        int          DoubleWordSupport (double word support flag)
        # CCURPMFC_FALSE              (h/w double word transfers not
                                       supported)
        # CCURPMFC_TRUE               (h/w double word transfers
                                       supported)

Output: volatile void *Destination    (pointer to destination buffer)
Return: none

```

\*\*\*\*\*/

### 2.2.144 ccurPMFC\_Fraction\_To\_Hex()

This converts a fractional decimal to a hexadecimal value.

\*\*\*\*\*/

```

int
ccurPMFC_Fraction_To_Hex (double Fraction,
                          uint   *value)

```

Description: Convert Fractional Decimal to Hexadecimal

Input: double Fraction (fraction to convert)  
Output: uint \*value; (converted hexadecimal value)  
Return: 1 (call failed)  
0 (good return)

\*\*\*\*\*/

## 2.2.145 ccurPMFC\_Get\_All\_Boards\_Driver\_Info()

This call returns driver information for all the *ccurpmfc* cards that have been found in the system.

\*\*\*\*\*/

```
_ccurpmfc_lib_error_number_t  
ccurPMFC_Get_All_Boards_Driver_Info(void *Handle,  
                                     ccurpmfc_all_boards_driver_info *all_boards_info)
```

Description: Get device information from driver for all boards.

```
Input: void *Handle (Handle pointer)  
Output: ccurpmfc_driver_info_t *all_boards_info (info struct pointer)

*****/

```

## 2.2.152 ccurPMFC\_Get\_Interrupt\_Timeout\_Seconds()

This call returns the read time out maintained by the driver. It is the time that the read call will wait before it times out. The call could time out because a DMA fails to complete. The device should have been opened in the block mode (*O\_NONBLOCK* not set) for reads to wait for the operation to complete.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_Interrupt_Timeout_Seconds (void      *Handle,
                                         int       *int_timeout_secs)

Description: Get Interrupt Timeout Seconds

Input:  void      *Handle          (Handle pointer)
Output: int       *int_timeout_secs (pointer to int tout secs)
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)

        # CCURPMFC_LIB_INVALID_ARG   (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_IOCTL_FAILED  (ioctl error)
*****/

```

## 2.2.153 ccurPMFC\_Get\_Lib\_Error()

This call provides detailed information about the last library error that was maintained by the API. The call itself can fail with a return code if an invalid handle is provided, the device is not open or device authorization has failed. If the call succeeds *CCURPMFC\_LIB\_NO\_ERROR*, the last library error information is supplied to the user in the *ccurpmfc\_lib\_error\_t* structure.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_Lib_Error (void      *Handle,
                       ccurpmfc_lib_error_t *lib_error)

Description: Get last error generated by the library.

Input:  void      *Handle          (Handle pointer)
Output: ccurpmfc_lib_error_t *lib_error (error struct pointer)
        -- uint error              (last library error number)
        -- char name[CCURPMFC_LIB_ERROR_NAME_SIZE] (last library error name)
        -- char desc[CCURPMFC_LIB_ERROR_DESC_SIZE] (last library error description)
        -- int line_number          (last library error line number in lib)
        -- char function[CCURPMFC_LIB_ERROR_FUNC_SIZE]
                                   (library function in error)
        -- ccurpmfc_lib_error_backtrace_t BT[CCURPMFC_BACK_TRACE_DEPTH]

    *****/

```

### 2.2.155 ccurPMFC\_Get\_Mapped\_Config\_Ptr()

If the user wishes to bypass the API and communicate directly with the board configuration registers, then they can use this call to acquire a pointer to these registers. Please note that any type of access (read or write) by bypassing the API could compromise the API and results could be unpredictable. It is recommended that only advanced users should use this call and with extreme care and intimate knowledge of the hardware programming registers before attempting to access these registers. For information on the registers, refer to the *ccurpmfc\_user.h* include file that is supplied with the driver.

```

/*****
    __ccurpmfc_lib_error_number_t

```

```

ccurPMFC_Get_Mapped_Config_Ptr (void *Handle,
                                ccurpmfc_config_local_data_t **config_ptr)

```

Description: Get mapped configuration pointer.

```

Input:  void *Handle (Handle pointer)
Output: ccurpmfc_config_local_data_t **config_ptr (config struct ptr)
        -- structure in ccurpmfc_user.h
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR (successful)
        # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN (device not open)
        # CCURPMFC_LIB_INVALID_ARG (invalid argument)
        # CCURPMFC_LIB_NO_CONFIG_REGION (config region not present)
*****/

```

## 2.2.156 ccurPMFC\_Get\_Mapped\_Driver\_Library\_Ptr()

The driver and library share a common structure. This call returns a pointer to the shared driver/library structure.

```

/*****
ccurPMFC_Get_Mapped_Driver_Library_Ptr()
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_Mapped_Driver_Library_Ptr (void *Handle,
                                        ccurpmfc_driver_library_common_t **driver_lib_ptr)

Description: Get mapped Driver/Library structure pointer.

Input:  void *Handle (Handle pointer)
Output: ccurpmfc_driver_library_common_t **driver_lib_ptr (driver_lib
        struct ptr)
        -- structure in ccurpmfc_user.h
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR (successful)
        # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN (device not open)
        # CCURPMFC_LIB_INVALID_ARG (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)

*****/

```

## 2.2.157 ccurPMFC\_Get\_Mapped\_Local\_Ptr()

If the user wishes to bypass the API and communicate directly with the board control and data registers, then they can use this call to acquire a pointer to these registers. Please note that any type of access (read or write) by bypassing the API could compromise the API and results could be unpredictable. It is recommended that only advanced users should use this call and with extreme care and intimate knowledge of the hardware programming registers before attempting to access these registers. For information on the registers, refer to the *ccurpmfc\_user.h* include file that is supplied with the driver.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_Mapped_Local_Ptr (void *Handle,
                               ccurpmfc_local_ctrl_data_t **local_ptr)

Description: Get mapped local pointer.

Input:  void *Handle (Handle pointer)
Output: ccurpmfc_local_ctrl_data_t **local_ptr (local struct ptr)

```

```

-- structure in ccurpmfc_user.h
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (device not open)
        # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
*****/

```

## 2.2.158 ccurPMFC\_Get\_Open\_File\_Descriptor()

When the library *ccurPMFC\_Open()* call is successfully invoked, the board is opened using the system call *open(2)*. The file descriptor associated with this board is returned to the user with this call. This call allows advanced users to bypass the library and communicate directly with the driver with calls like *read(2)*, *ioctl(2)*, etc. Normally, this is not recommended as internal checking and locking is bypassed and the library calls can no longer maintain integrity of the functions. This is only provided for advanced users who want more control and are aware of the implications.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_Open_File_Descriptor (void *Handle,
                                   int *fd)

Description: Get Open File Descriptor

Input:  void          *Handle (Handle pointer)
Output: int          *fd    (open file descriptor)
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (device not open)
        # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
*****/

```

## 2.2.159 ccurPMFC\_Get\_Physical\_Memory()

This call returns to the user the physical memory pointer and size that was previously allocated by the *ccurPMFC\_Mmap\_Physical\_Memory()* call. The physical memory is allocated by the user when they wish to perform their own DMA and bypass the API. If user specified a mmaped user memory pointer, search for it, otherwise, simply return the contents of the physical memory list specified by a valid entry\_num\_in\_tran\_table. Once again, this call is only useful for advanced users.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_Physical_Memory (void          *Handle,
                              ccurpmfc_user_phys_mem_t *phys_mem)

Description: Get previously mmaped() physical memory address and size

Input:  void          *Handle (Handle pointer)
        ccurpmfc_user_phys_mem_t *phys_mem (mem struct pointer)
        void          *mmaped_user_mem_ptr (mmaped user virtual
                                             memory)
        uint          entry_num_in_tran_table
                                             (entry number in translation table)
Output: ccurpmfc_user_phys_mem_t *phys_mem (mem struct pointer)
        uint          user_pid
        void          *phys_mem_ptr
        void          *driver_virt_mem_ptr
        void          *mmaped_user_mem_ptr
        uint          phys_mem_size

```

```

        uint                phys_mem_size_freed
        uint                entry_num_in_tran_table
        uint                num_of_entries_used
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN                (device not open)
        # CCURPMFC_LIB_INVALID_ARG            (invalid argument)
        # CCURPMFC_LIB_IOCTL_FAILED           (driver ioctl call failed)
*****/

```

### 2.2.160 ccurPMFC\_Get\_RunCount\_UserProcess()

This call returns to the user a count of the number of times the User Process has entered. *(This is an experimental API for debugging and testing).*

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_RunCount_UserProcess(void                *UFuncHandle,
                                unsigned int long long *RunCount)

Description: Get run count in user process

Input:  void                *UFuncHandle (UF Handle pointer))
Output: unsigned int long long *RunCount (pointer to run count)
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
*****/

```

### 2.2.161 ccurPMFC\_Get\_TestBus\_Control()

This call is provided for internal use in testing the hardware.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_TestBus_Control (void                *Handle,
                              _ccurpmfc_testbus_control_t *test_control)

Description: Return the value of the Test Bus control information

Input:  void                *Handle (handle pointer)
Output: _ccurpmfc_testbus_control_t
        *test_control (pointer to control select)
        # CCURPMFC_TBUS_CONTROL_OPEN
        # CCURPMFC_TBUS_CONTROL_CAL_BUS
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_NO_LOCAL_REGION        (local region error)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN                (device not open)
*****/

```

### 2.2.162 ccurPMFC\_Get\_Value()

This call allows the user to read the board registers. The actual data returned will depend on the command register information that is requested. Refer to the hardware manual for more information on what is being returned. Most commands return a pointer to an unsigned integer.

```

/*****
_ccurpmfc_lib_error_number_t

```

```

ccurPMFC_Get_Value (void          *Handle,
                    CCURPMFC_CONTROL cmd,
                    void           *value)

```

Description: Return the value of the specified board register.

```

Input:  void          *Handle      (Handle pointer)
        CCURPMFC_CONTROL cmd      (register definition)
        -- structure in ccurpmfc_lib.h

```

```

Output: void          *value;      (pointer to value)

```

```

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN      (device not open)
        # CCURPMFC_LIB_INVALID_ARG   (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)

```

```

*****/

```

### 2.2.163 ccurPMFC\_Hex\_To\_Fraction()

This call converts a hexadecimal value to a fractional decimal.

```

/*****
double
ccurPMFC_Hex_To_Fraction (uint value)

```

Description: Convert Hexadecimal to Fractional Decimal

```

Input:  uint      value      (hexadecimal to convert)

```

```

Output: none

```

```

Return: double Fraction      (converted fractional value)

```

```

*****/

```

### 2.2.164 ccurPMFC\_Identify\_Board()

This call is useful in identifying a physical board via software control. It causes the front LED to either blink or turn off. Users can also specify the number of seconds they wish to blink the LED.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Identify_Board (void          *Handle,
                        _ccurpmfc_identify_t Identify)

```

Description: Identify the board by setting the front LED

```

Input:  void          *Handle      (Handle pointer)
        _ccurpmfc_identify_t Identify (Identify board settings)
        # CCURPMFC_IDENTIFY_OFF
        # CCURPMFC_IDENTIFY_ON
        # Number of seconds to blink

```

```

Output: none

```

```

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_NOT_OPEN      (device not open)
        # CCURPMFC_LIB_INVALID_ARG   (invalid argument)

```

```

*****/

```

### 2.2.165 ccurPMFC\_Initialize\_Board()

This call initializes the driver structures to a default state and then resets the hardware.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_Initialize_Board (void *Handle)

  Description: Initialize the board.

  Input:   void          *Handle          (Handle pointer)
  Output:  none
  Return:  _ccurpmfc_lib_error_number_t
           # CCURPMFC_LIB_NO_ERROR        (successful)
           # CCURPMFC_LIB_BAD_HANDLE     (no/bad handler supplied)
           # CCURPMFC_LIB_NOT_OPEN      (device not open)
           # CCURPMFC_LIB_IOCTL_FAILED  (driver ioctl call failed)
           # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
*****/

```

### 2.2.166 ccurPMFC\_IpCore\_COS\_Activate()

This call is the first call to use after the system is powered up to enable the IpCore COS module. This call can also be used to de-activate the module and get the current state of the module.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_IpCore_COS_Activate (void          *Handle,
                                _ccurpmfc_ipcore_cos_ip_enable_t  activate,
                                _ccurpmfc_ipcore_cos_status_disabled_t
                                *current_state)

  Description: Activate/DeActivate IP Core COS module

  Input:   void          *Handle (Handle pointer)
           _ccurpmfc_ipcore_cos_ip_enable_t  activate (activate/deactivate)
           # CCURPMFC_IPCORE_COS_IP_ENABLE
           # CCURPMFC_IPCORE_COS_IP_DISABLE
           # CCURPMFC_IPCODE_COS_IP_ENABLE_DO_NOT_CHANGE
  Output:  _ccurpmfc_ipcore_cos_status_disabled_t *current_state
           (active/deactive)
           # CCURPMFC_IPCORE_COS_STATUS_IP_ENABLED
           # CCURPMFC_IPCORE_COS_STATUS_IP_DISABLED
  Return:  _ccurpmfc_lib_error_number_t
           # CCURPMFC_LIB_NO_ERROR        (successful)
           # CCURPMFC_LIB_BAD_HANDLE     (no/bad handler supplied)
           # CCURPMFC_LIB_NOT_OPEN      (device not open)
           # CCURPMFC_LIB_INVALID_ARG   (invalid argument)
           # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
           # CCURPMFC_LIB_NO_RESOURCE   (COS ip core not present)
*****/

```

### 2.2.167 ccurPMFC\_IpCore\_COS\_Configure()

The purpose of this call is to configure the Ip Core COS module. If the core is not active, it will activate it. User can decide to immediately start capture at the end of the configuration with the StartStop option. The test mode is simply provided for debugging the hardware and software. Users need to specify at least one channel to detect a change of state, otherwise the call will fail.

A point to note is that when this call is issued, the sampling timer is restarted.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_IpCore_COS_Configure (void          *Handle,

```

ccurpmfc\_ipcore\_cos\_configure\_t \*config)

Description: Configure IP Core Change-of-State

```
Input:  void                    *Handle (Handle pointer)
Output: ccurpmfc_ipcore_cos_configure_t *config (pointer to config Struct)
        u_int32_t              StartStop
        # CCURPMFC_IPCORE_COS_STOP_CAPTURE
        # CCURPMFC_IPCORE_COS_START_CAPTURE
        u_int32_t              OperationalMode
        # CCURPMFC_IPCORE_COS_ENABLE_NORMAL_MODE
        # CCURPMFC_IPCORE_COS_ENABLE_TEST_MODE
        u_int32_t              TestModePattern
        # CCURPMFC_IPCORE_COS_TEST_PATTERN_ALTERNATING
        # CCURPMFC_IPCORE_COS_TEST_PATTERN_INCREMENT
        u_iny32_t              TestModeDivider
        # CCURPMFC_IPCORE_COS_TEST_DIVIDER_1
        # CCURPMFC_IPCORE_COS_TEST_DIVIDER_2
        # CCURPMFC_IPCORE_COS_TEST_DIVIDER_4
        # CCURPMFC_IPCORE_COS_TEST_DIVIDER_8
        # CCURPMFC_IPCORE_COS_TEST_DIVIDER_16
        # CCURPMFC_IPCORE_COS_TEST_DIVIDER_32
        # CCURPMFC_IPCORE_COS_TEST_DIVIDER_64
        # CCURPMFC_IPCORE_COS_TEST_DIVIDER_128
        u_int32_t              ChannelMask_31_00
        u_int32_t              ChannelMask_63_32
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE             (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN               (device not open)
        # CCURPMFC_LIB_INVALID_ARG           (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION        (local region not present)
        # CCURPMFC_LIB_NO_RESOURCE           (COS Ip core not present)
*****/
```

## 2.2.168 ccurPMFC\_IpCore\_COS\_Decode\_Timestamp()

This is a useful call that is available to the user to decode the raw timestamp of the change-of-state that is supplied to the call.

```
/******
void
ccurPMFC_IpCore_COS_Decode_Timestamp (uint          timestamp_31_00,

## 2.2.170 ccurPMFC\_IpCore\_COS\_Read()

This call reads the COS FIFO and returns any raw change-of-state elements that have been detected by the firmware. The maximum size of the FIFO is *CCURPMFC\_IPCORE\_COS\_MAX\_READ\_ELEMENTS* elements. The call requires as input the number of samples to read. This can be any number between 1 and

*CCURPMFC\_IPCORE\_COS\_MAX\_READ\_ELEMENTS*. Additionally, the user needs to select the mode of transfer, i.e. DMA or PIO. If DMA mode is selected, the user has the option to select the DMA engine *CCURPMFC\_DMA0* or *CCURPMFC\_DMA1*. An additional option to this call is to decode any raw change-of-state elements detected by setting the *timestamp* option to *CCURPMFC\_TRUE*.

The call returns the number of elements that it read along with the raw and decoded information. If an overflow condition occurs (i.e. the FIFO gets full and the firmware is unable to add another change of state detected) all available elements are returned up to the user requested count and the overflow condition is cleared. Overflow can occur if the rate of change is state detection is very high and the application is unable to read the FIFO before turning around to collect more data. In that case, the application needs to speed up the process of capturing the data or reducing the rate of change of state.

```

*****/
```

## 2.2.172 ccurPMFC\_IpCore\_Get\_Info()

This call returns information of all the IP Core modules available. The COS core will return a *CCURPMFC\_IPCODE\_CHANGE\_OF\_STATE* code in *IpCoreCode*. Additional information about the core is also returned.

This call also returns to the user a memory mapped pointer address that the user can use to directly access the IP Core and bypass the driver and API. This type of access to the hardware should only be performed by Advanced users who are extremely familiar with both the hardware and internals of the core, otherwise, the system operation could be compromised.

```

## 2.2.174 ccurPMFC\_MMap\_Physical\_Memory()

This call is provided for advanced users to create a physical memory of specified size that can be used for DMA or MsgDMA. The allocated DMA memory is rounded to a page size. If a physical memory is not

available, this call will fail, at which point the user will need to issue the `ccurPMFC_Munmap_Physical_Memory()` API call to remove any previously allocated physical memory.

When user wishes to allocate a physical memory, they must make sure that the `phys_mem_ptr` in the `ccurpmfc_user_phys_mem_t` structure is set to 0, otherwise the call will fail.

Instead of creating a physical memory, this same call can be used to map a user specified region if **region addressing** support is enabled as part of the Cloning feature. In this case, the user will need to supply a valid physical address of a Cloning Region to the `phys_mem_ptr` argument in this call.

Additionally, it is meaningless to perform Cloning on a FIFO region for two reasons. Firstly, each data in a FIFO is synchronous, however, the Cloned region is accessed asynchronously. Secondly, when the FIFO runs empty (*underflow*) or cannot accept more data (*overflow*) the results are unpredictable.

**Caution:** *Since physical addresses are supplied for the MsgDma operation, care must be taken to ensure that the supplied addresses are valid and that while DMA is in progress, the memory regions must not be freed or made inactive, otherwise, the results could be unpredictable and could lead to the possible corruption of the system.*

If the user supplies a non-zero `phys_mem_ptr` argument, the driver will attempt to request access to the memory region supplied by the user. If access to the region is denied, the call will fail. Reasons for access being denied is because the region has been reserved by some other process and is possibly in use. In this case, if the user still wishes to get access to the region, they can do so *at their own risk* by supplying the `CCURPMFC_DISABLE_REGION_PROTECTION` flag to the `flags` argument. If the call still fails, there is no way for the user to access the memory region as the kernel controls this access. One such reason is that the user is trying to access an invalid region.

Whether a physical memory is acquired by the driver or supplied by the user, the driver by default *caches* the memory region and returns a mapped virtual address to the user. If the user does not wish the region to be *cached*, they can supply the `CCURPMFC_DISABLE_ADDRESS_CACHE` flag to the `flags` argument. This may be useful if the user is running into problems with the region being *cached*, however, a noticeable performance degradation will be observed when accessing the region.

The `CCURPMFC_DEVICE_ADDRESS_ENTRY` is used internally by the driver and is only available as information to the user.

*****/

```

### 2.2.175 `ccurPMFC_MsgDma_Clone()` (*Patent-Pending*)

This call allows the user to Clone a transfer so that the process is continuously performing MsgDma once it has started until the Cloning operation is stopped by the user. This approach is different from standard MsgDma where a user has to re-initiate a MsgDma transfer every time it completes.

The following are the operation modes for this call:

- `CCURPMFC_MSGDMA_CLONE_INITIALIZE`
- `CCURPMFC_MSGDMA_CLONE_ONE_CYCLE_WAIT`
- `CCURPMFC_MSGDMA_CLONE_START`
- `CCURPMFC_MSGDMA_CLONE_STOP`

In order to perform a Cloning operation, the user first performs the same functions of MsgDma to seize, configure descriptors and MsgDma setup using the `ccurPMFC_MsgDma_Seize()`, `ccurPMFC_MsgDma_Configure_Descriptor()` and `ccurPMFC_MsgDma_Setup()` calls. Once that is done, the user needs to stop any previous MsgDma operation and initialize the cloning operation using (`CCURPMFC_MSGDMA_CLONE_STOP` | `CCURPMFC_MSGDMA_CLONE_INITIALIZE`) modes.

Now, whenever the user is ready, they can commence cloning operation with the `CCURPMFC_MSGDMA_CLONE_START` mode. At this point, MsgDma transfers start occurring continuously at the hardware level. If a chained MsgDma is configured, the entire chain is completed before it is repeated. Once Cloning has commenced, it can be stopped with the help of the `CCURPMFC_MSGDMA_CLONE_STOP` mode.

Once the operation has started with the `CCURPMFC_MSGDMA_CLONE_START` mode, it will run continuously under hardware control until stopped. There is no way to determine precisely how long a single descriptor cycle takes to complete. If the `CCURPMFC_MSGDMA_CLONE_ONE_CYCLE_WAIT` mode is set along with the `CCURPMFC_MSGDMA_CLONE_START` mode, the call will be blocked for the first transfer until the full descriptor cycle has completed. This approximate duration is also saved internally in the driver and is available to the user in the `CloneArgs->MsgDmaExtDesOnlyCycleDelay` argument. Anytime the user wishes to block their application for a duration of approximately one cycle delay, they can invoke this call with the `CCURPMFC_MSGDMA_CLONE_ONE_CYCLE_WAIT` as the only mode. If the user wishes to block more or less than the one cycle delay whenever the call is issued, they can specify the number of additional nano-seconds to block in the `CloneArgs->AdditionalOneCycleDelay`. A negative value will reduce the delay while a positive value will increase it. This call will have no effect on the Cloning operation in progress.

This Cloning feature can prove very helpful to users who don't want to perform single MsgDma calls to transfer a region from a card to a physical memory that is continuously changing. They can basically Clone the two regions and simply read the physical memory while the hardware is continuously updating it with the latest data from the card region at MsgDma rate. There is no CPU overhead during Cloning, however, it will be utilizing the PCI bus during its operation.

Only one Cloning or MsgDma operation can be active at a given time. Additionally, it is meaningless to perform Cloning on a FIFO region for two reasons. Firstly, each data in a FIFO is synchronous, however, the Cloned region is accessed asynchronously. Secondly, when the FIFO runs empty (*underflow*) or cannot accept more data (*overflow*) the results are unpredictable.

**Caution:** *Since physical addresses are supplied for the MsgDma operation, care must be taken to ensure that the supplied addresses are valid and that while Cloning is in progress, the memory regions must not be freed or made inactive, otherwise, the results could be unpredictable and could lead to the possible corruption of the system.*

```

## 2.2.176 ccurPMFC\_MsgDma\_Configure\_Descriptor()

This call assists the user in setting up modular scatter-gather DMA descriptors. It allows the user to specify a read and write address offset along with length of transfer. Additionally, the call also provides the option to attach to other previously created descriptor blocks for scatter-gather operation. To perform scatter-gather DMA operation, the user creates a chain of descriptors, each having its own read/write/length information along with a start and end of the chain. The DMA operation is started from the first descriptor block in the chain and sequentially processes the descriptor blocks until the last descriptor block in the chain is processed.

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

To distinguish between descriptors, they are labeled with descriptor ID's. They range from ID 1 to 31. Users can supply a valid specific ID to this call or let the call itself find a free descriptor ID available. It is entirely left up to the user to determine how to manage the various descriptors and their relative linkages.

If the user wishes to have a previously created descriptor to point to a newly created descriptor, they can supply the previously created descriptor ID to the *AttachToDescriptorID* argument in the newly created descriptor. The newly created descriptor will not point to any descriptor and will always be the last descriptor in the chain.

DMA transfers can occur from either of the following:

1. Physical PCIe memory to Physical PCIe memory
2. Physical PCIe memory to Avalon Memory
3. Avalon Memory to Physical PCIe memory
4. Avalon Memory to Avalon Memory

There are certain restrictions and limitations to this scatter-gather operation:

1. Scatter-gather DMA is only supported in certain FPGA cards
2. Reads from Avalon memory below DiagRam location are not allowed for MIOC FPGA cards.
3. Invalid memory address supplied could result in the scatter-gather IP to lock up and the only way to recover will be to reload the driver.
4. Read and write addresses must be at a minimum full-word aligned and for maximum performance, it is recommended to be quad-word aligned.
5. Lengths are in bytes and must be at a minimum a multiple of a full-word and for maximum performance, it is recommended to be quad-word multiple.
6. You cannot cause a chain of descriptors to loop on itself.

```

*****/

```

### 2.2.177 ccurPMFC\_MsgDma\_Configure\_Single()

This call performs a similar function to the *ccurPMFC\_MsgDma\_Configure()* call with the exception that no DMA chaining is performed and only the single descriptor ID-1 is used to perform the DMA operation. The user has the option to supply a valid descriptor block when using the *ccurPMFC\_MsgDma\_Configure\_Single()* API or a *NULL* pointer to the descriptor as an argument when using the *ccurPMFC\_Transfer\_Data()* API to perform the transfer.

Normally this call needs to be issued once with a *NULL* pointer for the *Descriptor* (i.e. during initialization) prior to using the *ccurPMFC\_Transfer\_Data()* call with the *LibMode* set to *CCURPMFC\_LIBRARY\_MSGDMA\_MOD*. In this way, the descriptor ID-1 will be set up correctly prior to the transfer.

If instead, the user wishes to perform the DMA operation using the *ccurPMFC\_MsgDma\_Fire\_Single()* call, they need to issue the *ccurPMFC\_MsgDma\_Configure\_Single()* call with a valid descriptor block, otherwise, results will be unpredictable.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_MsgDma_Configure_Single (void          *Handle,
                                ccurpmfc_msgdma_descriptor_t *Descriptor)

Description: Configure Single Modular Scatter-Gather DMA descriptor

        ccurpmfc_msgdma_descriptor_t *Descriptor (pointer to descriptor)
        __u64 ReadAddress
        __u64 WriteAddress
        __u32 Length

Output: none

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)
        # CCURPMFC_LIB_INVALID_ARG     (invalid argument)
        # CCURPMFC_LIB_DMA_BUSY        (MsgDma Busy, cannot be
                                        reset)
        # CCURPMFC_LIB_MSG_DMA_NOT_SUPPORTED (modular scatter-gather DMA
                                        not supported)
        # CCURPMFC_LIB_MSG_DMA_READS_NOT_ALLOWED_FOR_SELECTED_ADDRESS
                                        (MSG DMA Reads not allowed
                                        for selected address)
*****/

```

### 2.2.178 ccurPMFC\_MsgDma\_Fire()

This call initiates a scatter-gather DMA operation that has been previously configured and setup by the *ccurPMFC\_MsgDma\_Configure()* and *ccurPMFC\_MsgDma\_Setup()* call.

The *StartDescriptorID* can be set to either '0' or a valid Descriptor ID. Normally, the user will set the *StartDescriptorID* in the *ccurPMFC\_MsgDma\_Setup()* API during initialization and set it to '0' in this *ccurPMFC\_MsgDma\_Fire()* API. In this way, this call will not suffer the overhead of loading the *StartDescriptorID* in the internal prefetcher register when repeatedly calling the *ccurPMFC\_MsgDma\_Fire()* API. If the user specifies a valid *StartDescriptorID* that is already setup as a scatter-gather chain using the *ccurPMFC\_MsgDma\_Configure()* call, then this *ccurPMFC\_MsgDma\_Fire()* API will initiate the DMA starting with the user supplied start descriptor ID.

The *DescriptorIDMask* is a mask of all the valid descriptor ID's specified in the scatter-gather chain that was created earlier with the *ccurPMFC\_MsgDma\_Configure()* API. If this is incorrectly specified, the DMA operation will be unpredictable. This *ccurPMFC\_MsgDma\_Fire()* API call uses this mask to set the *ControlWord* for each of the IDs. Specifying this mask reduces the overhead in the call by not searching the scatter-gather chain to set the individual control words.

*ControlWord* for each descriptor is set based on the *DescriptorIDMask* mask. Normally, the following two flags are set:

- CCURPMFC\_MSGD\_DESC\_CONTROL\_GO
- CCURPMFC\_MSGD\_DESC\_CONTROL\_OWNED\_BY\_HW

*LastIdForInterrupts* is set to 0 if the DMA operation will use polling instead of using interrupts to detect completion of the operation. If interrupts are to be used, the ID of the last descriptor in the DMA chain is to be specified. This is the ID that will be interrupted when the entire chain is completed. Incorrect ID entered will result in unpredictable results. Normally, interrupt handling adds additional overhead and reduces performance, however, it reduces the overhead experienced by the CPU and PCIe bus during polling.

Once the scatter-gather DMA operation commences, it performs DMA operations starting with the *StartDescriptorID* and traversing through the chain sequentially until it reaches the last descriptor ID in the chain, at which point the DMA operation concludes.

```

*****/

```

### 2.2.179 ccurPMFC\_MsgDma\_Fire\_Single()

This call is similar in functionality to the *ccurPMFC\_MsgDma\_Fire()* call with the exception that it operates on the single descriptor ID-1. It can be used when a single DMA rather than scatter-gather DMA operation needs to be performed. This call can be called once the *ccurPMFC\_MsgDma\_Config\_Single()* call has been issued to set up the read/write address offset and length of transfer. Unless the read/write address offset or length of transfer is changed, the *ccurPMFC\_MsgDma\_Fire\_Single()* call can be made repeatedly to perform the same DMA transfer.

```

/*****
  _ccurpmfc_lib_error_number_t
  _ccurPMFC_MsgDma_Fire_Single (void *Handle,
                                int UseInterrupts)

Description: Fire Single Modular Scatter-Gather DMA descriptor

Input:  void *Handle           (Handle pointer)
        int UseInterrupts     (Use interrupts flag)
        # CCURPMFC_TRUE
        # CCURPMFC_FALSE

Output: none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
         # CCURPMFC_LIB_DMA_FAILED        (MsgDma failed)
         # CCURPMFC_LIB_DMA_BUSY          (MsgDma busy)
         # CCURPMFC_LIB_NOT_OWNER_OF_MSGDMA (not owner of modular
                                           scatter-gather)
*****/

```

*UseInterrupts* is a flag that can be set to specify if interrupt handling should be enabled.

### 2.2.180 ccurPMFC\_MsgDma\_Free\_Descriptor()

This call can be used to free up already used descriptors.

```

/*****
  _ccurpmfc_lib_error_number_t
  ccurPMFC_MsgDma_Free_Descriptor (void *Handle,
                                   _ccurpmfc_msgdma_descriptors_id_mask_t DescriptorIDMask)

Description: Free Modular Scatter-Gather DMA descriptor

Input:  void *Handle           (Handle pointer)
        _ccurpmfc_msgdma_descriptors_id_mask_t DescriptorIDMask
                                           (descriptor ID mask)
        # CCURPMFC_MSGDMA_DESCRIPTOR_ID_1_MASK ...
        # CCURPMFC_MSGDMA_DESCRIPTOR_ID_31_MASK
        # CCURPMFC_MSGDMA_DESCRIPTOR_ID_ALL_MASK

Output: none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)

```

```

# CCURPMFC_LIB_NOT_OPEN          (device not open)

*****/

```

### 2.2.184 *ccurPMFC\_MsgDma\_Release()*

This *ccurPMFC\_MsgDma\_Release()* API call is used to free up the Modular Scatter-Gather DMA resource that has been reserved by the *ccurPMFC\_MsgDma\_Seize()* API. At this point, another user can take control of the MsgDMA operation by issuing the *ccurPMFC\_MsgDma\_Seize()* call.

```

/*****
__ccurpmfc_lib_error_number_t  ccurPMFC_MsgDma_Release (void *Handle)

Description: Release MsgDMA operation for others to use

Input:   void                *Handle (Handle pointer)
Output:  none
Return:  __ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
        # CCURPMFC_LIB_MSGDMA_NOT_SUPPORTED    (modular scatter-gather DMA
                                                not supported)
        # CCURPMFC_LIB_DMA_BUSY                (MsgDma Busy, cannot be
                                                reset)
        # CCURPMFC_LIB_NOT_OWNER_OF_MSGDMA     (not owner of modular
                                                scatter-gather)
*****/

```

### 2.2.185 *ccurPMFC\_MsgDma\_Seize()*

Modular Scatter-Gather DMA is a two part operation. The first part is to configure the Scatter-Gather DMA and the second part is to execute the DMA. Various MsgDma API calls have been provided for this. Since this two part operation is not atomic, it is necessary for the user of these calls to prevent other applications from configuring and using the MsgDMA resources while it is being actively used by another application. For this reason, the *ccurPMFC\_MsgDma\_Seize()* and *ccurPMFC\_MsgDma\_Release()* API calls have been introduced to assist the user in preventing other applications from accessing the Scatter-Gather DMA resource while it is reserved. Basically, before any MsgDma API call is issued that could modify the setting and execution of the MsgDma operation, the user needs to issue the *ccurPMFC\_MsgDma\_Seize()* API call once. In this way, on one else will have access to the MsgDma resource until the application has issued the *ccurPMFC\_MsgDma\_Release()* API call or has terminated.

```

/*****
__ccurpmfc_lib_error_number_t  ccurPMFC_MsgDma_Seize (void *Handle)

Description: Seize MsgDMA operation for private to use and become owner

Input:   void                *Handle (Handle pointer)

```

```

Output: none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN          (device not open)
         # CCURPMFC_LIB_MSGDMA_NOT_SUPPORTED (modular scatter-gather DMA
                                         not supported)
         # CCURPMFC_LIB_MSGDMA_IN_USE     (modular scatter-gather DMA in
                                         use)
*****/

```

## 2.2.186 ccurPMFC\_MsgDma\_Setup()

This call is used in conjunction with the *ccurPMFC\_MsgDma\_Configure()* and *ccurPMFC\_MsgDma\_Fire()* calls. This call is made after all the descriptors are first configured with the help of the *ccurPMFC\_MsgDma\_Configure()* call. The purpose of this call is to specify the first descriptor in the chain. Additionally, the user can set the *ForceReset* flag to reset the dispatcher and prefetcher. Optionally, the user can request useful active descriptor information if *ActiveDescriptorsInfo* argument is specified (*i.e not NULL*). In addition to returning useful active descriptor information, the descriptor chain and prefetcher settings are also validated for proper configuration.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_MsgDma_Setup (void                *Handle,
                    _ccurpmfc_msgdma_descriptors_id_t StartDescriptorID,
                    int ForceReset,
                    ccurpmfc_msgdma_active_descriptors_info_t *ActiveDescriptorsInfo)

```

Description: Setup MsgDMA Dispatcher and Prefetcher

```

Input:  void                *Handle (Handle pointer)
        _ccurpmfc_msgdma_descriptors_id_t *StartDescriptorID (Set
        # CCURPMFC_MSGDMA_DESCRIPTOR_ID_1 ... to valid ID)
        CCURPMFC_MSGDMA_DESCRIPTOR_ID_31
        int ForceReset
Output: ccurpmfc_msgdma_active_descriptors_info_t *ActiveDescriptorsInfo;
        _ccurpmfc_msgdma_descriptors_id_t ID
        # CCURPMFC_MSGDMA_DESCRIPTOR_ID_1 ...
        CCURPMFC_MSGDMA_DESCRIPTOR_ID_31
        _ccurpmfc_msgdma_descriptors_id_mask_t Mask
        # CCURPMFC_MSGDMA_DESCRIPTOR_ID_1_MASK ...
        CCURPMFC_MSGDMA_DESCRIPTOR_ID_31_MASK
        # CCURPMFC_MSGDMA_DESCRIPTOR_ID_ALL_MASK
        __u32 NumberOfDescriptors
        __u32 TotalBytes
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (device not open)
        # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
        # CCURPMFC_LIB_DMA_BUSY          (MsgDma Busy, cannot be
                                         reset)
        # CCURPMFC_LIB_ERROR_IN_DESCRIPTOR_LIST (invalid descriptor list)
        # CCURPMFC_LIB_MSG_DMA_NOT_SUPPORTED (modular scatter-gather
                                         DMA not supported)
        # CCURPMFC_LIB_NOT_OWNER_OF_MSGDMA (not owner of modular
                                         scatter-gather)
*****/

```

## 2.2.187 ccurPMFC\_Munmap\_Physical\_Memory()

This call simply removes a physical memory that was previously allocated by the *ccurPMFC\_MMap\_Physical\_Memory()* API call.

```
/******  
_ccurpmfc_lib_error_number_t  
ccurPMFC_Munmap_Physical_Memory (void *Handle,  
                                void *mmaped_user_mem_ptr)  
  
Description: Unmap a previously mapped physical DMA memory.  
  
Input:  void *Handle (Handle pointer)  
Output: void *mmaped_user_mem_ptr (virtual memory pointer)  
Return: _ccurpmfc_lib_error_number_t  
        # CCURPMFC_LIB_NO_ERROR (successful)  
        # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)  
        # CCURPMFC_LIB_NOT_OPEN (device not open)  
        # CCURPMFC_LIB_INVALID_ARG (invalid argument)  
        # CCURPMFC_LIB_MUNMAP_FAILED (failed to un-map memory)  
        # CCURPMFC_LIB_NOT_MAPPED (memory not mapped)  
        # CCURPMFC_LIB_MSGDMA_IN_USE (modular scatter-gather DMA  
                                     in use)  
*****/
```

## 2.2.188 ccurPMFC\_NanoDelay()

This call goes into a tight loop spinning for the requested nano seconds specified by the user.

```
/******  
void  
ccurPMFC_NanoDelay (unsigned long long NanoDelay)  
  
Description: Delay (loop) for user specified nano-seconds  
  
Input:  unsigned long long NanoDelay (number of nano-secs to delay)  
Output: none  
Return: none  
*****/
```

## 2.2.189 ccurPMFC\_Open()

This is the first call that needs to be issued by a user to open a device and access the board through the rest of the API calls. What is returned is a handle to a *void pointer* that is supplied as an argument to the other API calls. The *Board\_Number* is a valid board number [0..9] that is associated with a physical card. There must exist a character special file */dev/ccurpmfc<Board\_Number>* for the call to be successful. One character special file is created for each board found when the driver is successfully loaded.

The *oflag* is the flag supplied to the *open(2)* system call by this API. It is normally '0' (*zero*), however the user may use the *O\_NONBLOCK* option for *read(2)* calls which will change the default reading in block mode.

This driver allows multiple applications to open the same board by specifying an additional *oflag O\_APPEND*. It is then the responsibility of the user to ensure that the various applications communicating with the same cards are properly synchronized. Various tests supplied in this package has the *O\_APPEND* flags enabled, however, it is strongly recommended that only one application be run with a single card at a time, unless the user is well aware of how the applications are going to interact with each other and accept any unpredictable results.

In case of error, *errno* is also set for some non-system related errors encountered.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Open (void    **My_Handle,
                int     Board_Number,
                int     oflag)

Description: Open a device.

Input:   void    **Handle    (Handle pointer to pointer)
         int     Board_Number (0-9 board number)
         int     oflag       (open flags)

Output:  none

Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_INVALID_ARG   (invalid argument)
         # CCURPMFC_LIB_ALREADY_OPEN  (device already opened)
         # CCURPMFC_LIB_OPEN_FAILED   (device open failed)
         # CCURPMFC_LIB_ALREADY_MAPPED (memory already mmaped)
         # CCURPMFC_LIB_MMAP_SELECT_FAILED (mmap selection failed)
         # CCURPMFC_LIB_MMAP_FAILED   (mmap failed)
*****/

```

## 2.2.190 ccurPMFC\_Pause\_UserProcess()

This call causes a running User Process to sleep for user specified micro-seconds. (*This is an experimental API for debugging and testing*).

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Pause_UserProcess(void *UFuncHandle,
                            int  usleep)

Description: Pause running user process

Input:   void    *UFuncHandle (UF Handle pointer)
         int     usleep       (micro-seconds sleep)

Output:  none

Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)
*****/

```

## 2.2.191 ccurPMFC\_Program\_All\_Output\_Clocks()

This is the main call to program all the output clocks with a single call. All existing clock activity is stopped and replaced with the new clocks selection. Though the user can select the Input Clock Frequency with this call, it is expected that they will use the default CCURPMFC\_DEFAULT\_INPUT\_CLOCK\_FREQUENCY value.

The input clock can be one of:

```

CCURPMFC_CG_INPUT_CLOCK_SELECT_IN0 → 10MHz TCX0 (Temperature Compensated
                                         Oscillator Clock).
CCURPMFC_CG_INPUT_CLOCK_SELECT_IN1 → External Input
CCURPMFC_CG_INPUT_CLOCK_SELECT_IN2 → FPGA Supplied
CCURPMFC_CG_INPUT_CLOCK_SELECT_INXAXB → Not used

```

When using this card, the default clock should be set to `CCURPMFC_CG_INPUT_CLOCK_SELECT_NO` i.e. the 10MHz internal clock.

If the desired output clock frequencies are unable to be computed due to hardware limitation, they may wish to increase the desired tolerance *DesiredTolerancePPT* for the particular clock. Note that this tolerance is only applicable to computing a clock value as close to the desired frequency *DesiredFrequency* and not a representation of the accuracy of the output clocks.

Additionally, the programming could fail if the number of N-Divider resource gets exhausted due to the user selecting several output clocks with widely different output clocks.

```

/*****
ccurPMFC_Program_All_Output_Clocks()
_ccurpmfc_lib_error_number_t
ccurPMFC_Program_All_Output_Clocks(void          *Handle,

        # CCURPMFC_LIB_CLOCK_GENERATION_FAILED (clock generation
                                                failed)
*****/

```

## 2.2.192 ccurPMFC\_Read()

This call performs a programmed I/O driver read of either the ADC *channel registers* or the *FIFO*. Prior to issuing this call, the user needs to set up the desired read mode of operation using the *ccurPMFC\_ADC\_Set\_Driver\_Read\_Mode()* with *CCURPMFC\_ADC\_PIO\_CHANNEL* or *CCURPMFC\_ADC\_PIO\_FIFO* argument. For *channel register* reads, the size is limited to *CCURPMFC\_MAX\_ADC\_CHANNELS* words and for *FIFO* reads, it is limited to *CCURPMFC\_ADC\_FIFO\_DATA\_MAX* words.

It basically calls the *read(2)* system call with the exception that it performs necessary *locking* and returns the *errno* returned from the system call in the pointer to the *error* variable. An *errno* of *ENOBUFS* can occur for *FIFO* reads when it encounters an overflow condition.

For specific information about the data being returned for the various read modes, refer to the *read(2)* system call description the *Driver Direct Access* section.

```

/*****
__ccurpmfc_lib_error_number_t
ccurPMFC_Read (void      *Handle,
                void      *buf,
                int       size,
                int       *bytes_read,
                int       *error)

```

Description: Perform a read operation.

```

Input:  void      *Handle      (Handle pointer)
        int       size        (size of buffer in bytes)
Output: void      *buf        (pointer to buffer)
        int       *bytes_read  (bytes read)
        int       *error      (returned errno)
Return: __ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR (successful)

```

```

# CCURPMFC_LIB_BAD_HANDLE      (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN       (device not open)
# CCURPMFC_LIB_IO_ERROR       (read failed)
*****/

```

### 2.2.193 ccurPMFC\_Reload\_Firmware()

The purpose of this call is to power cycle the board which in turn will reload the latest firmware on the board.

```

/*****
ccurPMFC_Reload_Firmware()

```

Description: This call power-cycles the board which in turn forces it to reload its firmware. Typically, this is called after a new firmware has been installed in the board. This saves the need to perform a system reboot after a firmware installation.

Input: void \*Handle (Handle pointer)

Output: none

Return: \_ccurpmfc\_lib\_error\_number\_t

```

# CCURPMFC_LIB_NO_ERROR      (successful)
# CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN     (device not open)
# CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)

```

```

*****/

```

### 2.2.194 ccurPMFC\_Remove\_Irq()

The purpose of this call is to remove the interrupt handler that was previously set up. The interrupt handler is managed internally by the driver and the library. The user should not issue this call, otherwise reads will time out.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Remove_Irq (void *Handle)

```

Description: By default, the driver sets up a shared IRQ interrupt handler when the device is opened. Now if for any reason, another device is sharing the same IRQ as this driver, the interrupt handler will also be entered every time the other shared device generates an interrupt. There are times that a user, for performance reasons may wish to run the board without interrupts enabled. In that case, they can issue this ioctl to remove the interrupt handling capability from the driver.

Input: void \*Handle (Handle pointer)

Output: none

Return: \_ccurpmfc\_lib\_error\_number\_t

```

# CCURPMFC_LIB_NO_ERROR      (successful)
# CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN     (device not open)
# CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)

```

```

*****/

```

### 2.2.195 ccurPMFC\_Reset\_Board()

This call resets the board to a known hardware state. It may be a good idea to start an application by first resetting the board so that it is set to a known state.

```

/*****

```

```
_ccurpmfc_lib_error_number_t
ccurPMFC_Reset_Board (void *Handle)
```

Description: Reset the board.

```
Input:  void *Handle          (Handle pointer)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN     (device not open)
        # CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
*****/
```

## 2.2.196 ccurPMFC\_Reset\_Clock()

This call performs a hardware reset of the clock. All active output clocks are stopped and set to default state. The user can activate clocks if they wish after a reset via the *activate* argument.

```
/******
_ccurpmfc_lib_error_number_t
ccurPMFC_Reset_Clock (void *Handle,
                     int activate)

Description: Perform Hardware Clock Reset

Input:  void          *Handle (Handle pointer)
        int          activate (1=activate after reset)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN     (device not open)
        # CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
*****/
```

## 2.2.197 ccurPMFC\_Resume\_UserProcess()

Use this call to resume an already paused User Process. (*This is an experimental API for debugging and testing*).

```
/******
_ccurpmfc_lib_error_number_t
ccurPMFC_Resume_UserProcess(void *UFuncHandle)

Description: Resume paused running user process

Input:  void          *UFuncHandle (UF Handle pointer)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
*****/
```

## 2.2.198 ccurPMFC\_Return\_Board\_Info\_Description()

Return board information description

```
/******
```

```

char *
ccurPMFC_Return_Board_Info_Description (_ccurpmfc_board_function_t
                                         BoardFunction)

Description: Return Board Information Description

Input:  _ccurpmfc_board_function_t  BoardFunction      (board function)
        # CCURPMFC_BOARD_FUNCTION_MULTIFUNCTION_IO
        # CCURPMFC_BOARD_FUNCTION_ENGINE_CONTROL
        # CCURPMFC_BOARD_FUNCTION_IPCORE_COS
        # CCURPMFC_BOARD_FUNCTION_BASE_LEVEL
        # CCURPMFC_BOARD_FUNCTION_CUSTOM_IPCORE
        # CCURPMFC_BOARD_FUNCTION_UNDEFINED

Output: none
Return: char                                         *BoardFuncDesc      (board function
                                                                    description)
*****/

```

## 2.2.199 ccurPMFC\_SDRAM\_Activate()

This call must be the first call to activate the SDRAM. Without activation, all other calls will fail. The user can also use this call to return the current state of the SDRAM without any change.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_SDRAM_Activate (void                *Handle,
                        _ccurpmfc_sdr_all_enable_t activate,
                        _ccurpmfc_sdr_all_enable_t *current_state)

Description: Activate/DeActivate SDRAM module

Input:  void                *Handle      (Handle pointer)
        _ccurpmfc_sdr_all_enable_t activate (activate/deactivate)
        # CCURPMFC_SDRAM_ALL_DISABLE
        # CCURPMFC_SDRAM_ALL_ENABLE
        # CCURPMFC_SDRAM_ALL_ENABLE_DO_NOT_CHANGE

Output: _ccurpmfc_sdr_all_enable_t *current_state (active/deactive)
        # CCURPMFC_SDRAM_ALL_DISABLE
        # CCURPMFC_SDRAM_ALL_ENABLE

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN        (device not open)
        # CCURPMFC_LIB_INVALID_ARG     (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
        # CCURPMFC_LIB_SDRAM_INITIALIZATION_FAILED (SDRAM init failed)
*****/

```

## 2.2.200 ccurPMFC\_SDRAM\_Get\_CSR()

This call returns the SDRAM control and status register information.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_SDRAM_Get_CSR (void                *Handle,
                        ccurpmfc_sdr_all_enable_t *sdr_all_enable,
                        ccurpmfc_sdr_all_enable_t *sdr_all_enable,
                        ccurpmfc_sdr_all_enable_t *sdr_all_enable,
                        ccurpmfc_sdr_all_enable_t *sdr_all_enable)

Description: Get SDRAM Control and Status information

Input:  void                *Handle      (Handle pointer)
Output: ccurpmfc_sdr_all_enable_t *sdr_all_enable (pointer to SDRAM csr)

```

```

_ccurpmfc_sdram_read_auto_increment_t  read_auto_increment;
# CCURPMFC_SDRAM_READ_AUTO_INCREMENT_DISABLE
# CCURPMFC_SDRAM_READ_AUTO_INCREMENT_ENABLE
_ccurpmfc_sdram_write_auto_increment_t  write_auto_increment;

# CCURPMFC_LIB_SDRAM_IS_NOT_ACTIVE     (SDRAM is not active)
*****/

```

### 2.2.201 ccurPMFC\_SDRAM\_Read()

This call provided the user the ability to read any portion of the SDRAM. Its range is from 1 to 0x10000000 (256Mwords). Offset to this routine is only set if it is 0 or greater. Maximum offset is 0x0FFFFFFF. If offset is negative, then the read commences from the last read location.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_SDRAM_Read (void      *Handle,
                      u_int32_t *Buf,
                      int       Offset,
                      u_int32_t Size,
                      u_int32_t *Words_read)

```

Description: Perform a SDRAM read operation.

Input:	void	*Handle	(Handle pointer)
	int	Offset	(word offset into SDRAM)
	u_int32_t	Size	(size of buffer in words)
Output:	u_int32_t	*Buf	(pointer to buffer)
	u_int32_t	*Words_read	(words read)

Return: \_ccurpmfc\_lib\_error\_number\_t  
# CCURPMFC\_LIB\_NO\_ERROR (successful)  
# CCURPMFC\_LIB\_NO\_LOCAL\_REGION (local region not present)  
# CCURPMFC\_LIB\_SDRAM\_IS\_NOT\_ACTIVE (SDRAM is not active)

```

*****/

```

### 2.2.202 ccurPMFC\_SDRAM\_Set\_CSR()

This call sets the SDRAM control and status register.

```

/*****
_ccurpmfc_lib_error_number_t

```

```
ccurPMFC_SDRAM_Set_CSR (void          *Handle,
                        ccurpmfc_sdram_csr_t *sdram_csr)
```

Description: Set SDRAM Control and Status information

```
Input:  void          *Handle  (Handle pointer)
        _ccurpmfc_sdram_read_auto_increment_t  read_auto_increment;
        # CCURPMFC_SDRAM_READ_AUTO_INCREMENT_DISABLE
        # CCURPMFC_SDRAM_READ_AUTO_INCREMENT_ENABLE
        # CCURPMFC_SDRAM_READ_AUTO_INCREMENT_DO_NOT_CHANGE
        _ccurpmfc_sdram_write_auto_increment_t  write_auto_increment;

        # CCURPMFC_LIB_SDRAM_IS_NOT_ACTIVE (SDRAM is not active)
*****/
```

## 2.2.203 ccurPMFC\_SDRAM\_Write()

This call provided the user the ability to write to any portion of the SDRAM. Its range is from 1 to 0x10000000 (256Mwords). Offset to this routine is only set if it is 0 or greater. Maximum offset is 0x0FFFFFFF. If offset is negative, then the write commences from the last written location.

```
/******
_ccurpmfc_lib_error_number_t
ccurPMFC_SDRAM_Write (void          *Handle,
                      u_int32_t     *Buf,
                      int            Offset,
                      u_int32_t     Size,
                      u_int32_t     *Words_written)
```

Description: Perform a SDRAM write operation.

```
Input:  void          *Handle  (Handle pointer)
        u_int32_t     *Buf     (pointer to buffer)
        int           Offset   (word offset into SDRAM)
        u_int32_t     Size     (size of buffer in words)
Output: u_int32_t     *Words_written (words written)
```

```

Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_NO_LOCAL_REGION    (local region not present)
        # CCURPMFC_LIB_SDRAM_IS_NOT_ACTIVE (SDRAM is not active)
*****/

```

## 2.2.204 ccurPMFC\_Set\_Board\_CSR()

This call is used to set the board control register.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Set_Board_CSR (void          *Handle,
                        ccurpmfc_board_csr_t *bcsr)

Description: Set Board Control and Status information

Input:  void          *Handle      (Handle pointer)
        ccurpmfc_board_csr_t *bcsr (pointer to board csr)
        _ccurpmfc_bcsr_identify_board_t identify_board
        # CCURPMFC_BCSR_IDENTIFY_BOARD_DISABLE
        # CCURPMFC_BCSR_IDENTIFY_BOARD_ENABLE

Output: none
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)

        # CCURPMFC_CB_DAC_CHANNEL_8
        # CCURPMFC_CB_DAC_CHANNEL_9

```

```

# CCURPMFC_CB_DAC_CHANNEL_10
# CCURPMFC_CB_DAC_CHANNEL_11
# CCURPMFC_CB_DAC_CHANNEL_12
# CCURPMFC_CB_DAC_CHANNEL_13
# CCURPMFC_CB_DAC_CHANNEL_14
# CCURPMFC_CB_DAC_CHANNEL_15
Return:  _ccurpmfc_lib_error_number_t
# CCURPMFC_LIB_NO_ERROR           (successful)
# CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN          (device not open)
# CCURPMFC_LIB_INVALID_ARG       (invalid argument)
# CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
*****/

```

## 2.2.206 ccurPMFC\_Set\_Interrupt\_Status()

This call sets/clears the various interrupts. In the case of DIO COS interrupts, the change-of-status for all the channels in a particular channel group (Group0=Ch00..31, Group1=Ch32..63, Group2=Ch64..95) are cleared in the DIO COS status registers in order to clear the corresponding DIO COS interrupt status.

```

/*****

```

```

*****/

```

## 2.2.207 ccurPMFC\_Set\_Interrupt\_Timeout\_Seconds()

This call sets the read *timeout* maintained by the driver. It allows the user to change the default time out from 30 seconds to a user specified value. It is the time that the read call will wait before it times out. The call could time out if the DMA fails to complete. The device should have been opened in the blocking mode (*O\_NONBLOCK* not set) for reads to wait for the operation to complete.

```
/******
_ccurpmfc_lib_error_number_t
ccurPMFC_Set_Interrupt_Timeout_Seconds (void      *Handle,
                                         int       timeout_secs)

Description: Set Interrupt Timeout Seconds

Input:   void      *Handle      (Handle pointer)
         int       timeout_secs (interrupt tout secs)

Output:  none

Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN     (device not open)
         # CCURPMFC_LIB_INVALID_ARG  (invalid argument)
*****/
```

## 2.2.208 ccurPMFC\_Set\_TestBus\_Control()

This call is provided for internal use in testing the hardware.

```
/******
_ccurpmfc_lib_error_number_t
ccurPMFC_Set_TestBus_Control (void      *Handle,
                              _ccurpmfc_testbus_control_t test_control)

Description: Set the value of the Test Bus control information

Input:   void      *Handle      (handle pointer)
Output:  _ccurpmfc_testbus_control_t
         test_control (control select)
         # CCURPMFC_TBUS_CONTROL_OPEN
         # CCURPMFC_TBUS_CONTROL_CAL_BUS

Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR      (successful)
         # CCURPMFC_LIB_NO_LOCAL_REGION (local region error)
         # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN     (device not open)
*****/
```

## 2.2.209 ccurPMFC\_Set\_Value()

This call allows the advanced user to set the writable board registers. The actual data written will depend on the command register information that is requested. Refer to the hardware manual for more information on what can be written to.

Normally, users should not be changing these registers as it will bypass the API integrity and could result in an unpredictable outcome.

```
/******
_ccurpmfc_lib_error_number_t
ccurPMFC_Set_Value (void      *Handle,
                   CCURPMFC_CONTROL cmd,
                   void        *value)
*****/
```

Description: Set the value of the specified board register.

```
Input:  void          *Handle      (Handle pointer)
        CCURPMFC_CONTROL cmd      (register definition)
        -- structure in ccurpmfc_lib.h
        void          *value      (pointer to value to be set)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR    (successful)
        # CCURPMFC_LIB_BAD_HANDLE  (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN    (device not open)
        # CCURPMFC_LIB_INVALID_ARG (invalid argument)
*****/
```

### 2.2.210 ccurPMFC\_SPROM\_Read()

This is a basic call to read short word entries from the serial prom. The user specifies a word offset within the serial prom and a word count, and the call returns the data read in a pointer to short words.

```
/******
_ccurpmfc_lib_error_number_t
ccurPMFC_SPROM_Read(void          *Handle,
                    ccurpmfc_sprom_rw_t *spr)
```

Description: Read Serial Prom for specified number of words

```
Input:  void          *Handle      (handle pointer)
        ccurpmfc_sprom_rw_t *spr    (pointer to struct)
        u_short word_offset
        u_short num_words
Output:  ccurpmfc_sprom_rw_t *spr    (pointer to struct)
        u_short *data_ptr
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR    (successful)
        # CCURPMFC_LIB_NO_LOCAL_REGION (error)
        # CCURPMFC_LIB_INVALID_ARG  (invalid argument)
        # CCURPMFC_LIB_SERIAL_PROM_BUSY (serial prom busy)
        # CCURPMFC_LIB_SERIAL_PROM_FAILURE (serial prom failure)
*****/
```

### 2.2.211 ccurPMFC\_SPROM\_Read\_Item()

This call is used to read well defined sections in the serial prom. The user supplies the serial prom section that needs to be read and the data is returned in a section specific structure.

```
/******
_ccurpmfc_lib_error_number_t
ccurPMFC_SPROM_Read_Item(void          *Handle,
                          _ccurpmfc_sprom_access_t item,
                          void          *item_ptr)
```

Description: Read Serial Prom for specified item

```
Input:  void          *Handle      (handle pointer)
        _ccurpmfc_sprom_access_t item (select item)
        # CCURPMFC_SPROM_HEADER
Output:  void          *item_ptr    (pointer to item struct)
        *ccurpmfc_sprom_header_t sprom_header
        u_int32_t board_serial_number
        u_short   sprom_revision
```

```

Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_NO_LOCAL_REGION    (error)
        # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
        # CCURPMFC_LIB_SERIAL_PROM_BUSY  (serial prom busy)
        # CCURPMFC_LIB_SERIAL_PROM_FAILURE (serial prom failure)
*****/

```

### 2.2.212 ccurPMFC\_SPROM\_Write()

This is a basic call to write short word entries to the serial prom. The user specifies a word offset within the serial prom and a word count, and the call writes the data pointed to by the *spw* pointer, in short words.

Prior to using this call, the user will need to issue the *ccurPMFC\_SPROM\_Write\_Override()* to allow writing to the serial prom.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_SPROM_Write(void          *Handle,
                    ccurpmfc_sprom_rw_t *spw)

Description: Write data to Serial Prom for specified number of words

Input:      void          *Handle    (handle pointer)
            ccurpmfc_sprom_rw_t *spw  (pointer to struct)
            u_short word_offset
            u_short num_words
            u_short *data_ptr

Output:     none

Return:     _ccurpmfc_lib_error_number_t
            # CCURPMFC_LIB_NO_ERROR           (successful)
            # CCURPMFC_LIB_NO_LOCAL_REGION    (error)
            # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
            # CCURPMFC_LIB_SERIAL_PROM_BUSY  (serial prom busy)
            # CCURPMFC_LIB_SERIAL_PROM_FAILURE (serial prom failure)
*****/

```

### 2.2.213 ccurPMFC\_SPROM\_Write\_Item()

This call is used to write well defined sections in the serial prom. The user supplies the serial prom section that needs to be written and the data points to the section specific structure. This call should normally not be used by the user.

Prior to using this call, the user will need to issue the *ccurPMFC\_SPROM\_Write\_Override()* to allowing writing to the serial prom.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_SPROM_Write_Item(void      *Handle,
                          _ccurpmfc_sprom_access_t item,
                          void      *item_ptr)

Description: Write Serial Prom with specified item

Input:      void          *Handle    (handle pointer)
            _ccurpmfc_sprom_access_t item  (select item)
            # CCURPMFC_SPROM_HEADER
            void          *item_ptr  (pointer to item struct)
            *ccurpmfc_sprom_header_t sprom_header
            u_int32_t      board_serial_number
            u_short        sprom_revision

```

```

Output:      none
Return:  _ccurpmfc_lib_error_number_t
          # CCURPMFC_LIB_NO_ERROR           (successful)
          # CCURPMFC_LIB_NO_LOCAL_REGION    (error)
          # CCURPMFC_LIB_INVALID_ARG        (invalid argument)
          # CCURPMFC_LIB_SERIAL_PROM_BUSY   (serial prom busy)
          # CCURPMFC_LIB_SERIAL_PROM_FAILURE (serial prom failure)
*****/

```

### 2.2.214 ccurPMFC\_SPROM\_Write\_Override()

The serial prom is non-volatile and its information is preserved during a power cycle. It contains useful information and settings that the customer could lose if they were to inadvertently overwrite. For this reason, all calls that write to the serial proms will fail with a write protect error, unless this write protect override API is invoked prior to writing to the serial proms. Once the Write Override is enabled, it will stay in effect until the user closes the device or re-issues this call to disable writes to the serial prom.

The calls that will fail unless the write protect is disabled are:

- ccurPMFC\_Write\_Serial\_Prom()
- ccurPMFC\_Write\_Serial\_Prom\_Item()

When *action* is set to *CCURPMFC\_TRUE*, the serial prom write protecting is disabled, otherwise, it is enabled.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_SPROM_Write_Override (void *Handle,
                               int action)

Description: Set Serial Prom Write Override

Input:      void          *Handle      (handle pointer)
            int           action       (override action)
            # CCURPMFC_TRUE
            # CCURPMFC_FALSE

Output:     none
Return:    _ccurpmfc_lib_error_number_t
           # CCURPMFC_LIB_NO_ERROR      (successful)
           # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)
           # CCURPMFC_LIB_NOT_OPEN      (device not open)
           # CCURPMFC_LIB_INVALID_ARG   (invalid argument)
           # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
*****/

```

### 2.2.215 ccurPMFC\_Transfer\_Data()

This is the main call that the user can use to transfer data from physical memory that the user has previously allocated to a region in the local register, and vice-versa. The operation can be performed via DMA or programmed I/O mode. In the case of DMA mode, the user can select whether interrupts are to be used to wait for DMA to complete instead of polling. User can also specify which DMA engine to use during this operation.

If the board supports modular scatter-gather DMA, then the user can specify that instead of the basic DMA engine. In this case, the user needs to first call the *ccurPMFC\_MsgDma\_Configure\_Single()* with the *NULL* argument to setup descriptor ID-1 for scatter-gather DMA operation.

When scatter-gather DMA is selected, the *DmaEngineNo* argument is ignored and the *IoControl* argument must be set to *CCURPMFC\_DMA\_CONTROL\_INCREMENT*.

There are certain limitations to modular scatter-gather feature:

1. Scatter-gather DMA is only supported in certain cards
2. Reads from Avalon memory below DiagRam location are not allowed for MIOC FPGA cards.
3. Invalid memory address supplied could result in the scatter-gather IP to lock up and the only way to recover will be to reload the driver or reboot the system.
4. Read and write addresses must be at a minimum full-word aligned and for maximum performance, it is recommended to be quad-word aligned.
5. Lengths are in bytes and must be at a minimum a multiple of a full-word and for maximum performance, it is recommended to be quad-word multiple.
6. Scatter-gather chaining cannot be performed with this call.

/\*\*\*\*\*\*

```

_ccurpmfc_lib_error_number_t
ccurPMFC_Transfer_Data(void          *Handle,
                        volatile void *PciDmaMemory,
                        volatile void *AvalonMem,
                        uint          TransferSize,
                        _ccurpmfc_direction_t XferDirection,

### 2.2.216 ccurPMFC\_Update\_Clock\_Generator\_Divider()

Update the selected clock generator divider so that its changes take affect. *Normally, this call should not be used. It is recommended that only advanced users should use this call and with extreme care and intimate knowledge of the clock programming, otherwise results would be indeterminate.*

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Update_Clock_Generator_Divider (void          *Handle,
                                         _ccurpmfc_clock_generator_divider_t WhichDivider)

```

Description: Update Clock Generator Divider

```

Input:  void          *Handle          (Handle pointer)
        _ccurpmfc_clock_generator_divider_t WhichDivider (select divider)
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_M
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_N0
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_N1
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_N2
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_N3
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_N_ALL
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_P0
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_P1
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_P2
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_PFB
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_P_ALL
        # CCURPMFC_CLOCK_GENERATOR_DIVIDER_PXAXB

```

Output: none

```

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (library not open)
        # CCURPMFC_LIB_NO_LOCAL_REGION   (local region error)
        # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
        # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)

```

```

*****/

```

### 2.2.217 ccurPMFC\_UserProcess\_Command()

The user can control the execution of the created User Process with the help of this call. *(This is an experimental API for debugging and testing).*

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_UserProcess_Command(void          *Handle,
                              void          *UFuncHandle,
                              ccurpmfc_uf_action_t Action)

```

Description: Command User process

```

Input:  void          *UFuncHandle (User Process Handle pointer)
        ccurpmfc_uf_action_t Action (command action)
        # CCURPMFC_UF_ACTION_STOP
        # CCURPMFC_UF_ACTION_RUN
        # CCURPMFC_UF_ACTION_TERMINATE

```

```

Output: none
Return: none
*****/

```

### 2.2.218 ccurPMFC\_VoltsToData()

This call returns to the user the raw converted value for the requested voltage in the specified format. Voltage supplied must be within the input range of the selected board type. If the voltage is out of range, the call sets the voltage to the appropriate limit value.

```

/*****
uint
ccurPMFC_VoltsToData (double          volts,
                     ccurpmfc_volt_convert_t *conv)

Description: Convert Volts to data

Input:  double          volts          (volts to convert)
        ccurpmfc_volt_convert_t *conv  (pointer to conversion struct)
        double          VoltageRange  (maximum voltage range)
        _ccurpmfc_csr_dataformat_t Format (format)
        # CCURPMFC_OFFSET_BINARY
        # CCURPMFC_TWOS_COMPLEMENT
        ccurpmfc_bool    BiPolar      (bi-polar)
        # CCURPMFC_TRUE
        # CCURPMFC_FALSE
        int              ResolutionBits (Number of resolution bits)
Output: none
Return: uint           data           (returned data)
*****/

```

### 2.2.219 ccurPMFC\_Wait\_For\_Interrupt()

This call is made available to advanced users to bypass the API and perform their own data collection. The user can wait for a DMA complete interrupt. If a time out value greater than zero is specified, the call will time out after the specified seconds, otherwise it will not time out.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Wait_For_Interrupt (void          *Handle,
                             ccurpmfc_driver_int_t *drv_int)

Description: Wait For Interrupt

Input:  void          *Handle          (Handle pointer)
        ccurpmfc_driver_int_t *drv_int (pointer to drv_int struct)
        uint          WakeupInterruptMask
        # CCURPMFC_DMA0_INTMASK
        # CCURPMFC_DMA1_INTMASK
        # CCURPMFC_MSGDMA_INTMASK
        # CCURPMFC_ADC_FIFO_INTMASK
        # CCURPMFC_DAC_FIFO_INTMASK
        int          timeout_seconds
Output: ccurpmfc_driver_int_t *drv_int (pointer to drv_int struct)
        long long unsigned count
        long long unsigned dma_count[CCURPMFC_DMA_MAX_ENGINES]
        long long unsigned MsgDma_count
        uint          InterruptsOccurredMask
        uint          WakeupInterruptMask
        int          DmaControl      (DMA control flags)

```

```

        # CCURPMFC_DMA_CONTROL_RCON      (read constant)
        # CCURPMFC_DMA_CONTROL_WCON      (write constant)
        # CCURPMFC_DMA_CONTROL_INCREMENT (increment)
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (device not open)

```

## 2.2.220 ccurPMFC\_Write()

This call is currently not supported.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Write (void      *Handle,
                void      *buf,
                int        size,
                int        *bytes_written,
                int        *error)

```

Description: Perform a write operation.

```

Input:  void      *Handle      (Handle pointer)
        int        size        (number of bytes to write)
Output: void      *buf        (pointer to buffer)
        int        *bytes_written (bytes written)
        int        *error      (returned errno)

```

```

Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN          (device not open)
        # CCURPMFC_LIB_IO_ERROR          (write failed)
        # CCURPMFC_LIB_NOT_IMPLEMENTED   (call not implemented)
*****/

```

### 3. Test Programs

This driver and API are accompanied with an extensive set of test examples. Examples under the *Direct Driver Access* do not use the API, while those under *Application Program Interface Access* use the API.

#### 3.1 Direct Driver Access Example Tests

These set of tests are located in the `.../test` directory and do not use the API. They communicate directly with the driver. Users should be extremely familiar with both the driver and the hardware registers if they wish to communicate directly with the hardware.

##### 3.1.1 ccurpmfc\_disp

Useful program to display the local board registers. This program uses the *curses* library.

```
Usage: ./ccurpmfc_disp [-b BoardNo] [-d Delay] [-l LoopCnt] [-o Offset] [-s Size]
-b BoardNo (Board number -- default is 0)
-d Delay (Delay between screen refresh -- default is 0)
-l LoopCnt (Loop count -- default is 0)
-o Offset (Hex offset to read from -- default is 0x0)
-s Size (Number of bytes to read -- default is 0x400)
```

Example display:

```
./ccurpmfc_disp

Board Number [-b]: 0
Delay [-d]: 0 milli-seconds
Loop Count [-l]: ***Forever***
Offset [-o]: 0x00000000
Size [-s]: 1024 (bytes)

ScanCount = 59758

      00      04      08      0C      10      14      18      1C

### 3.1.3 ccurpmfc\_rdreg

This is a simple program that returns the local register value for a given offset.

```

Usage: ./ccurpmfc_rdreg [-b Board] [-C] [-f] [-o Offset] [-s Size]
  -b Board    : Board number -- default board is 0
  -C          : Select Config Registers instead of Local Registers
  -f          : Fast Memory Reads
  -o Offset   : Hex offset to read from -- default offset is 0x0
  -s Size     : Number of bytes to read in decimal -- default size is 0x4

```

Example display:

```
./ccurpmfc_rdreg -s64
```

Device Name: /dev/ccurpmfc0

LOCAL REGION: Physical Addr=0xc4900000 Size=65536 (0x00010000)  
CONFIG REGION: Physical Addr=0xc4910000 Size=32768 (0x00008000)

LOCAL: Register 0x7ffff7fe7000 Offset=0x0 Size=0x00010000  
CONFIG: Register 0x7ffff7fdf000 Offset=0x0 Size=0x00008000  
LIBPTR: Register 0x7ffff7fdd000 Offset=0x0 Size=0x00001070

```

### 3.1.7 ccurpmfc\_wreg

This is a simple test to write to the local registers at the user specified offset.

```

Usage: ./ccurpmfc_wreg [-b Board] [-C] [-o Offset] [-s Size] [-v Value] [-x]
-b Board   : Board selection -- default board is 0
-C         : Select Config Registers instead of Local Registers
-o Offset  : Hex offset to write to -- default offset is 0x0
-s Size    : Number of bytes to write in decimal -- default size is 0x4
-v Value   : Hex value to write at offset -- default value is 0x0
-x        : Do not read back just written values -- default read back values

```

#### Example display:

```
./ccurpmfc_wreg -v12345678 -o0x8000 -s400
```

Device Name: /dev/ccurpmfc0

```

LOCAL REGION: Physical Addr=0xc4900000 Size=65536 (0x00010000)
CONFIG REGION: Physical Addr=0xc4910000 Size=32768 (0x00008000)

```

```

LOCAL: Register 0x7ffff7fe7000 Offset=0x0 Size=0x00010000
CONFIG: Register 0x7ffff7fd0000 Offset=0x0 Size=0x00008000
LIBPTR: Register 0x7ffff7fdd000 Offset=0x0 Size=0x00001070

```

Writing 0x12345678 to offset 0x8000 for 400 bytes

```

```

### 3.1.8 Flash/ccurpmfc\_flash

This program is used to burn new firmware or update the license of an already installed firmware. It can also be used to reload the firmware on the card. This must only be done at the direction of Concurrent Real-Time support team, otherwise, they could render the board useless.

```
./ccurpmfc_flash -b[Board] -B -F[!] -i -L -q -Q -r[OutFile] -R -v -w[InFile] -X
-b [Board]      : Board number. Must be specified
-B             : Reload Base Level Firmware if MultiFirmware support present
-F            : Force Read Flash: Overwrite output file if exists
-F            : Force Write Flash: Do not abort Flash burn for header label
              mismatch
-F!           : Force Write Flash: Serious override required to continue
              burning
-i            : Query chip, on-board flash and InFile if specified
-L            : Update License only. (default is to update entire firmware)
-q            : Quiet (non-interactive) mode
-Q            : Quiet (non-interactive) mode. Also dump FPGAWB message
-r            : Read Flash and write to output file created by
              ./ccurpmfc_flash
-r [OutFile]   : Read Flash and write to output file 'OutFile'
-R            : Reload Firmware at sector address in Flash
-R [SectorNumber] : Reload Firmware at sector address 'SectorNumber'
-v            : Enable verbose mode
-w [InFile]   : Read input FPGA file and Flash the board
-X            : Use Full File. Do not truncate for firmware write
```

```
===== Notes =====
Board must be specified. Use '-b' option
Query option '-i' not allowed with '-B', '-R#', '-L', 'r' or '-X' options
Firmware reload '-B' or '-R' not allowed with '-i', '-L', '-r', '-w' or '-X'
options
Firmware read flash '-r' not allowed with '-B', '-i', '-L', '-R', '-w' or '-X'
options
Base Run Level '-B' or '-R#' option not allowed with '-i', '-L', 'r', '-w' or
'-X' options
Must specify write flash option '-w' when License only option '-L' is specified
License only option '-L' not allowed with '-B', '-i', '-R', '-w' or '-X'
options
Don't truncate file option '-X' cannot be selected with the license only update
'-L' option
Don't truncate file option '-X' can only be used with the '-w' option
Inquiry '-i' can be used '-w' options
=====
```

```
e.g. ./ccurpmfc_flash -b0                (Query chip and on-board Flash)
     ./ccurpmfc_flash -b0 -i            (Query chip and on-board Flash)
     ./ccurpmfc_flash -b0 -i -w InFile  (Query chip, on-board Flash and InFile)
     ./ccurpmfc_flash -b0 -r OutFile    (On-board FPGA ==> OutFile)
     ./ccurpmfc_flash -b0 -w InFile     (InFile ==> On-board FPGA - use
     truncated file)
     ./ccurpmfc_flash -b0 -w InFile -v  (InFile ==> On-board FPGA - use
     truncated file - verbose)
     ./ccurpmfc_flash -b0 -w InFile -X  (InFile ==> On-board FPGA - use entire
     file)
     ./ccurpmfc_flash -b0 -w InFile -L  (InFile ==> On-board FPGA - only
     license updated - interactive)
     ./ccurpmfc_flash -b0 -w InFile -L -q (InFile ==> On-board FPGA - only
     license updated - non-interactive)
     ./ccurpmfc_flash -b0 -R            (Reload Firmware - i.e. power-cycle the
     card) - Run Level
     ./ccurpmfc_flash -b0 -B            (Reload Firmware - i.e. power-cycle the
```

```

./ccurpmfc_flash -b0 -R 0      card) - Base Level
                                (Reload Firmware - i.e. power-cycle the
./ccurpmfc_flash -b0 -R 200   card) - Base Level
                                (Reload Firmware - i.e. power-cycle the
                                card) - at sector 200

```

*If the installed firmware is a Multi-Level firmware and you are running at Base Level, then the only utility that will be able to access the card will be this **ccurpmfc\_flash** utility. You will need to switch to Run Level before un-restricted access is allowed to the card.*

### 3.1.9 Flash/ccurpmfc\_label

This utility is only supplied for those customers that are creating their own firmware and need to install in a RedHawk system. In its simplest form, the customer will request a License file from Concurrent Real-Time for the option to burn their custom firmware. The license file (\*.lic) supplied by Concurrent Real-Time, along with the customer firmware (\*.rpd) file will be supplied to this utility to create a burnable FPGA file (\*.cust), that will be supplied to the *ccurpmfc\_flash* utility to burn the firmware on the card.

The user can also supply the '-x' option to additionally create a license only file (\*.cust.liconly) file that is associated with the firmware (.rpd). This is useful if you only wish to update the license information of a card that already has the same firmware installed. This is similar to having a (\*.cust) file and using the '-L' option when running the *ccurpmfc\_flash* utility.

```

./ccurpmfc_label -d[OutputDirectory] -c[ChipName] -F -i[InputFile] -K[FpgawbKey]
                  -L[LicenseFile] -m[MemberCode] -o[OutputFile]
                  -S[RunLevelSectorAddress] -t[Tag] -x
-d [OutputDirectory] : Directory to use for Output File
-c [ChipName]       : Chip Name. One of:
                    EPCQ16 EPCQ32 EPCQ64 EPCQ128 EPCQ256 EPCQ512
                    (This option is mandatory if not specified in license file)
-F                 : Force overwriting of output file if it exists
-i [InputFile]     : Raw input file. (.rpd extension)
-K [FpgawbKey]    : Fpgawb Key is required if license contains FPGA workbench
                    restriction
-L [LicenseFile]   : License file (.lic extension) to restrict firmware access (this
                    option is mandatory)
                    If '-i' option is not specified, the license file is dumped to
                    stderr
-m [MemberCode]    : Specify Member Code (A1,A3,A5,A7,B1,B3,B5,B7)
                    (This option is mandatory if not specified in license file)
-o [OutputFile]    : Use output file instead of the default file created by the
                    program
-S [RunLevelSectorAddress] : Run Level Sector Address. (This option is mandatory if not
                    specified in license file)
                    : S0=Base Level, S#=Run Level Number
-t [Tag]           : Insert this tag name in the default file created by the program
-x                 : Create an additional License only file (*.liconly)

```

==== Notes =====

- Options '-L' is required. If option '-i' is not specified, license file is dumped
- Options 'c', '-m' and '-S' are required if they have not already been defined in LicenseFile
- You cannot specify a Run Level Sector '-S' with Single Level Firmware '-1' option
- Run Level Sector address of zero '-S0' represents the Base Level Firmware in Multi-Firmware support
- If option '-o' is not specified, the created customer FPGA file name will be as follows: <OutputDirectory>/<InputFile>\_<Tag>\_<Function>\_<ChipName><MemberCode><RunLevel>.cust
- If the license file contains an FPGAWB restrict key, then the '-K' FpgawbKey is required

```

e.g. ./ccurpmfc_label -iraw_file.rpd -L LicenseFile.lic (in its simplest form)
      (output file created is: 'raw_file_<Function>_<ChipName><MemberCode><RunLevel>.cust')
      ./ccurpmfc_label -L LicenseFile.lic (this will display licensing information)

```

```
./ccurpmfc_label -iraw_RUN_file.rpd -ooutput_file.cust -S100 -L LicenseFile.lic
./ccurpmfc_label -iraw_SINGLE_file.rpd -L LicenseFile.lic
./ccurpmfc_label -iraw_RUN_file.rpd -ooutput_file.cust -S200 -L LicenseFile.lic
./ccurpmfc_label -iraw_BASE_file.rpd -S0 -L LicenseFile.lic
(Will cause firmware to be loaded at start offset Base Run Level)
```

### 3.1.10 Flash/ccurpmfc\_dump\_license

This utility allows the customer to dump the license information from a firmware (\*.cust) file or the (\*.liconly) file.

Format: ./ccurpmfc\_dump\_license <Firmware file>

This utility only dumps the license information from the \*.cust file and not the \*.lic license file

e.g ./ccurpmfc\_dump\_license COS\_IpCoreCOS\_EPCQ256A5S100.cust  
./ccurpmfc\_dump\_license COS\_IpCoreCOS\_EPCQ256A5S100.cust.liconly

## 3.2 Application Program Interface (API) Access Example Tests

These set of tests are in the `.../test/lib` directory and use the API.

### 3.2.1 lib/ccurpmfc\_adc

This test performs validation of the Multi-Function ADC card.

```
Usage: ./ccurpmfc_adc [-A] [-a RollingAve] [-b BoardNo] [-C AdcUpdateClock]
[-d Delay] [-D DMAEngine] [-E ExpInpVolt] [-f DataFormat]
[-F DebugFile] [-i] [-l LoopCnt] [-m XferMode]
[-n NumChans] [-N] [-s InputSignal] [-t Compare]
[-T TestBus] [-V MaxBoardVolts]

-A (Perform Auto Calibration first using reference voltage)
-a RollingAve (Rolling average -- default "=== None ===")
-b BoardNo (Board number -- default is 0)
-C AdcUpdateClock (select ADC update clock, 0..6 or 'n|N')
  -C 0,6 (Ch0..7=Clock0, Ch8..15=Clock6 at MAX SPS)
  -C 6@20000.0/n (Ch0..7=Clock6 at 20000 SPS, Ch8..15=No Clock)
  -C 4 (Ch0..15=Clock4 at MAX SPS)
  -C 4@150000.0 (Ch0..15=Clock4) at 150000 SPS
-d Delay (Delay between screen refresh -- default is 0
milli-seconds)
-D DMA Engine (DMA Engine number -- default = 1)
-E <ExpInpVolts>@<Tol> (Expected Input Volts@Tolerance -- default Tol=0.003000)
  +@<Tol> (Positive Calibration Ref Volt@Tolerance)
  -@<Tol> (Negative Calibration Ref Volt@Tolerance)
  s@<Tol> (Requires '-s' input signal option to specify voltage
Volt@Tolerance)
(valid '-s' arguments are 'g','+', '-','f','t')
-f DataFormat (select data format, '2' or 'b')
  -f b,2 (Ch0..7=Offset binary, Ch8..15=Two's complement)
  -f 2/b (Ch0..7=Two's complement, Ch8..15=Offset binary)
  -f b (Ch0..15=Offset binary)
-F DebugFile (Debug file with menu display -- default "=== None ===")
  #DebugFile (Debug file without display (only summary) -- default
"=== None ===")
  @DebugFile (Debug file without display -- default "=== None ===")
  ~DebugFile (For gnuplot, no header or summary -- default
"=== None ===")
  @, # or ~ (No debug file and no display -- default "=== None ===")
-i (Enable Interrupts -- default = Disable)
-l LoopCnt (Loop count -- default is 0)
-m XferMode (Transfer Mode -- default = 'DMA Channel')
  -mdp (Driver: (Channel Registers) PIO mode)
  -mdP (Driver: (FIFO) PIO mode)
  -mlc (Library: (Channel Registers) program I/O Fast Memory
Copy)
  -mld (Library: (Channel Registers) DMA mode)
  -mLD (Library: (FIFO) DMA mode)
  -mlp (Library: (Channel Registers) PIO)
  -mlP (Library: (FIFO) PIO mode)
-n NumChans (Number of channels -- default is 16)
-N (Open device with O_NONBLOCK flag)
-s InputSignal (select input signal, 'e', 'g', '+', '-', 't', 'f',
'0..15')
  -s e,g (Ch0..7=External input, Ch8..15=ground calibration)
  -s +/e (Ch0..7=Postive calibration, Ch8..15=external reference)
  -s - (Ch0..15=Negative calibration)
  -s t (Ch0..15=2.5 volt calibration)
  -s e/f (Ch0..7=external reference, Ch8..15=5 volt calibration)
```

```

-s e/12          (Ch0..7=external reference, Ch8..15=DAC Channel 12)
-t Compare      (Compare two channels for +/- -- default is
                "=== None ===")
-t0,15         (Compare channel 0 and 15 for being in sync)
-t5/7          (Compare channel 5 and 7 for being in sync)
-t12,4@0.500  (Compare channel 4 and 12 for being in sync with 0.5V
                tolerance)
-T TestBus     (Test Bus Control 'b' or 'o'. Exit after programming
                this option)
-T b           (Calibration Bus Control)
-T o           (Open Bus Control)
-V MaxBoardVolts (Voltage range 'b5' or 'b10')
-V b5,b10     (Ch0..7=5V, Ch8..15=10V)
-Vb10/b5     (Ch0..7=10V, Ch8..15=5V)
-V b10       (Ch0..15=10V)

e.g. ./ccurpmfc_adc -A -C0@150000.0/1@1234.0 -se/+ (Autocal, ADC0=150000Hz
external input, ADC1=1234Hz
Positive Cal.)
./ccurpmfc_adc -A -C0 -s+ -E+ (Autocal, Max Clock, Positive
cal. input, validate result)
./ccurpmfc_adc -A -C0 -s- -t0,15 -a100 (Autocal, Max Clock, Negative
cal. input, compare ch0 and
ch15, rolling ave=100)
./ccurpmfc_adc -C0 -Vb10 -s- -Es (Max Clock, -9.91V input,
validate against -9.91V)
./ccurpmfc_adc -C0 -Vb10 -st -Es (Max Clock, +2.5V input,
validate against +2.5V)

```

Example display:

### 3.2.2 lib/ccurpmfc\_adc\_calibrate

This test is useful for performing, saving and restoring ADC calibration.

Usage: ./ccurpmfc\_adc\_calibrate [-A] [-b board] [-i inCalFile] [-o outCalFile] [-R]

- A (perform Auto Calibration)
- b <board> (board #, default = 0)
- i <In Cal File> (input calibration file [input->board\_reg])
- o <Out Cal File> (output calibration file [board\_reg->output])
- R (reset ADC calibration)

e.g. ./ccurpmfc\_adc\_calibrate (Dump calibration information to stdout)

```

./ccurpmfc_adc_calibrate -A -o Calfile (Perform Auto calibration and dump
information to 'Calfile')
./ccurpmfc_adc_calibrate -i Calfile (Update board calibration with
supplied 'Calfile')
./ccurpmfc_adc_calibrate -R (Reset ADC calibration)

```

### Example display:

```

./ccurpmfc_adc_calibrate -A
Device Name      : /dev/ccurpmfc0
Board Serial No: 674459 (0x000a4a9b)
Auto Calibration started...done. (0.721 seconds)

==> Dump to 'stdout'
#Date           : Thu Jan 20 10:01:28 2022

### 3.2.3 lib/ccurpmfc\_adc\_fifo

This test performs validation of the Multi-Function ADC FIFO operation of the card.

```

Usage: ./ccurpmfc_adc_fifo [-A] [-b BoardNo] [-c ChannelSelectMask]
                        [-C AdcUpdateClock] [-d Delay] [-D DMAEngine]
                        [-E ExpInpVolt] [-f DataFormat] [-F DebugFile] [-i]
                        [-l LoopCnt] [-m XferMode] [-N] [-s InputSignal]
                        [-S NumberOfSamples] [-T TestBus] [-V MaxBoardVolts]
-A (Perform Auto Calibration first using reference voltage)
-b BoardNo (Board number -- default is 0)
-c ChannelSelectMask (Specify channel selection mask 0x0..0xffff)
-C AdcUpdateClock (select ADC update clock, 0..6 or 'n|N')
  -C 0,6 (Ch0..7=Clock0, Ch8..15=Clock6 at MAX SPS)
  -C 6@20000.0/n (Ch0..7=Clock6 at 20000 SPS, Ch8..15=No Clock)
  -C 4 (Ch0..15=Clock4 at MAX SPS)
  -C 4@150000.0 (Ch0..15=Clock4) at 150000 SPS
-d Delay (Delay between screen refresh -- default is 0
milli-seconds)
-D DMA Engine (DMA Engine number -- default = 1)
-E <ExpInpVolts>@<Tol> (Expected Input Volts@Tolerance -- default Tol=0.003000)
  +@<Tol> (Positive Calibration Ref Volt@Tolerance)
  -@<Tol> (Negative Calibration Ref Volt@Tolerance)
  s@<Tol> (Requires '-s' input signal option to specify voltage
Volt@Tolerance)
(valid '-s' arguments are 'g','+', '-', 'f','t')

```

```

-f DataFormat          (select data format, '2' or 'b')
  -f b,2              (Ch0..7=Offset binary, Ch8..15=Two's complement)
  -f 2/b              (Ch0..7=Two's complement, Ch8..15=Offset binary)
  -f b                (Ch0..15=Offset binary)
-F DebugFile          (Debug file with menu display -- default "=== None ===")
  @DebugFile         (Debug file without display -- default "=== None ===")
  @                  (No debug file and no display -- default "=== None ===")
-i                   (Enable Interrupts -- default = Disable)
-l LoopCnt            (Loop count -- default is 0)
-m XferMode           (Transfer Mode -- default = Library DMA or MsgDma if
  supported)
  -mdP               (Driver: (FIFO) PIO mode)
  -mLD               (Library: (FIFO) DMA mode)
  -mLP               (Library: (FIFO) PIO mode)
-N                   (Open device with O_NONBLOCK flag for driver operations)
-s InputSignal        (select input signal, 'e', 'g', '+', '-', 't', 'f',
  '0..15')
  -s e,g             (Ch0..7=External input, Ch8..15=ground calibration)
  -s +/e             (Ch0..7=Positive calibration, Ch8..15=external reference)
  -s -               (Ch0..15=Negative calibration)
  -s t               (Ch0..15=2.5 volt calibration)
  -s e/f             (Ch0..7=external reference, Ch8..15=5 volt calibration)
  -s e/12            (Ch0..7=external reference, Ch8..15=DAC Channel 12)
-S NumberOfSamples   (Number of Samples -- default is 49152)
-T TestBus           (Test Bus Control 'b' or 'o'. Exit after programming
  this option)
  -T b               (Calibration Bus Control)
  -T o               (Open Bus Control)
-V MaxBoardVolts     (Voltage range 'b5' or 'b10')
  -V b5,b10         (Ch0..7=5V, Ch8..15=10V)
  -Vb10/b5          (Ch0..7=10V, Ch8..15=5V)
  -V b10            (Ch0..15=10V)

```

```

e.g. ./ccurpmfc_adc_fifo -C0,1@100000 -se/+ (ADC0=300000Hz external input,
  ADC1=100000Hz Positive Cal.)
      ./ccurpmfc_adc_fifo -C0,1@100000 -Vb10 -s- -Es
  (Max Clock, -9.91V input,
  validate against -9.91V)
      ./ccurpmfc_adc_fifo -C0,1@100000 -Vb10 -st -Es
  (Max Clock, +2.5V input,
  validate against +2.5V)

```

#### Example display:

```
./ccurpmfc_adc_fifo -C0@300000,1@100000 -se/+ -l1000
```

```

Below are the statistics for 49152 samples:
  Estimated time to collect samples:      15368.294 usecs
  Total work time breakdown:              15371.225 usecs
  Average time to fill FIFO:              3407.085 usecs (### User blocking for FIFO to
fill ###)
  Average time to read samples:           11097.822 usecs (### This time excludes FIFO
fill time ###)
  Average time to process samples:        851.790 usecs
  Average time other:                     14.528 usecs
  Approximate free time available:        3418.682 usecs

```

### 3.2.4 lib/ccurpmfc\_adc\_sps

This is a useful tool to display the sample rate of various channels.

```

Usage: ./ccurpmfc_adc_sps [-b Board] [-c StartChan,StopChan] [-C AdcUpdateClock]
      [-E ExpSPS@Tol] [-l LoopCnt]
  -b Board          (Board number -- default is 0)
  -c StartChan,EndChan (Select start and end channel numners -- default 0,15
  -c 4,13          (select channels 4 through 13 for processing
  -c 7             (select channels 7 through 15 for processing
  -C AdcUpdateClock (select ADC update clock, 0..6 or 'n|N')
  -C 0,6          (Ch0..7=Clock0, Ch8..15=Clock6 at MAX SPS)
  -C 6@20000.0/n  (Ch0..7=Clock6 at 20000 SPS, Ch8..15=No Clock)
  -C 4            (Ch0..15=Clock4 at MAX SPS)

```

```

-C 4@150000.0      (Ch0..15=Clock4) at 150000 SPS
-E ExpSPS@Tol      (specify expected samples/second and tolerance for each
                   ADC)
-E C               (All ADC's to use clock samples/second and default
                   tolerance 0.010%)
-E c@0.02,30000    (ADC 0 uses clock samples/second and tolerance 0.02%,
                   remaining use 30,000 SPS and default tolerance 0.010%)
-E C@0.02,C        (All ADC's to use clock samples/second and default
                   tolerance except for ADC 0 tolerance of 0.02%)
-E 10000,c         (ADC 0 to use 10000 SPS, rest of ADCs to use clock
                   samples/second. Default tolerance for all ADCs)
-F DebugFile       (Debug file with menu display -- default "=== None ===")
 @DebugFile       (Debug file without menu display (only summary and rate
                   display) -- default "=== None ===")
 @                (No debug file and no menu display (only summary and
                   rate display) -- default "=== None ===")
-l LoopCnt         (Loop Count -- default is 10000000)
-l 0               (Loop forever)

```

e.g. ./ccurpmfc\_adc\_sps -C0@123456,1@78912 (ADC0 is 123456Hz, ADC1 is 78912Hz)

Example display:

```
./ccurpmfc_adc_sps -C0@123456,1@78912
```

```
local_ptr=0x7ffff7fd7000
```

```

```

### 3.2.5 lib/ccurpmfc\_check\_bus

This is a simple test to check whether there is interference from other cards that may be sharing the same bus. It simply computes the time it takes to perform hardware reads and computes the jitter. It must be run as *root*.

```

Usage: ./ccurpmfc_check_bus [-b Board] [-c CPU] [-l LoopCnt] [-t Tolerance]
-b Board      (Board number -- default is 0)
-c CPU        (CPU number -- default is 1)
-l LoopCnt    (Loop Count -- default is 1000000)
-l 0          (Loop forever)
-t Tolernace  (Tolerance -- default is 2.00 micro-seconds)

```

Example display:

```

sudo ./ccurpmfc_check_bus

local_ptr=0x7ffff7fd7000
10000000: usec/read: Cur=1.181 (Min=1.159 Max=1.794 Ave= 1.181335)
          [Bus Jitter (usec): 0.635 ==> LOW]

```

### 3.2.6 lib/ccurpmfc\_clock

This is a useful tool to display information of the various clocks and also program them.

```

Usage: ./ccurpmfc_clock [-b BoardNo] [-C UpdateClock] [-d Delay] [-l LoopCnt]
      [-R]
-b BoardNo    (Board number -- default is 0)
-C <Clock>@<Frequency> (set update clock '0..6' with frequency )
-d Delay      (Delay between screen refresh -- default is 10 milli-
              seconds)
-l LoopCnt    (Loop count -- default is 0)
-R            (Reset/Clear all clocks)

e.g. ./ccurpmfc_clock -C 1@300000
      (Set Clock 1 to 300000 SPS - do not change any other
      running clocks)
      ./ccurpmfc_clock -R -C0@100000 -C4@12345
      (Reset all clocks and then set Clock 0 to 100000 SPS and
      Clock 4 to 12345 SPS)

```

Example display:

```

./ccurpmfc_clock -R -C0@100000 -C4@12345

Board Number [-b]: 0
Delay [-d]: 10 milli-seconds
Loop Count [-l]: ***Forever***
Scan Count: 1258

### 3.2.7 lib/ccurpmfc\_dac

This test is useful in programming the DAC interface and displaying the DAC registers.

```
Usage: ./ccurpmfc_dac [-A] [-a RollingAve] [-b BoardNo] [-C AdcUpdateClock]
[-d Delay] [-D DMAEngine] [-E ExpInpVolt] [-f DataFormat]
[-F DebugFile] [-l LoopCnt] [-n NumChans] [-o OutputSelect]
[-s InputSignal] [-v DacVoltage] [-V OutputRange] [-Z]
-A (Perform DAC Auto Calibration first using reference
voltage)
-a RollingAve (Rolling average -- default "=== None ===")
-b BoardNo (Board number -- default is 0)
-C AdcUpdateClock (select ADC update clock, 0..6 or 'n')
-C 0,6 (Ch0..7=Clock0, Ch8..15=Clock6 at MAX SPS)
-C 6@20000.0/n (Ch0..7=Clock6 at 20000 SPS, Ch8..15=No Clock)
-C 4 (Ch0..15=Clock4 at MAX SPS)
-C 4@150000.0 (Ch0..15=Clock4) at 150000 SPS
-d Delay (Delay between screen refresh -- default is 0 milli-
seconds)
-D DMA Engine (DMA Engine number -- default = 1)
-E <ExpInpVolts>@<Tol> (Expected Input Volts@Tolerance -- default Tol=0.006000)
+@<Tol> (Positive Calibration Ref Volt@Tolerance)
-@<Tol> (Negative Calibration Ref Volt@Tolerance)
c@<Tol> (DAC Channel 0 Volt@Tolerance)
s@<Tol> (Requires '-s' input signal option to specify voltage
Volt@Tolerance)
Note: (valid '-s' arguments are 'g','+','-','f','t')
(For differential bipolar, even channels, voltage read
```

```

is half supplied)
(For differential bipolar, odd channels, voltage read is
neg. half supplied)
-f DataFormat          (select DAC data format, '2' or 'b')
  -f b,2              (Ch0..3=Offset binary, Ch4..15=Two's complement)
  -f 2/b,2           (Ch0..3 & Ch8..15=Two's complement, Ch4..7=Offset
                    binary)
  -f b               (Ch0..15=Offset binary)
-F DebugFile          (Debug file with menu display -- default "=== None ===")
  #DebugFile         (Debug file without display (only summary) -- default
                    "=== None ===")
  @DebugFile         (Debug file without display -- default "=== None ===")
  @ or #             (No debug file and no display -- default "=== None ===")
-l LoopCnt           (Loop count -- default is 0)
-n NumChans          (Number of channels (1..16) -- default is 16)
-o OutputSelect      (DAC output select, 's' or 'd')
  -o d,s             (Ch0..3=differential, Ch4..15=single_ended)
  -o s/d,s          (Ch0..3 & Ch8..15=single_ended, Ch4..7=differential)
  -o d              (Ch0..15=differential)
-s InputSignal       (ADC select input signal, 'a', 'e', 'g', '+', '-', 't',
                    'f', '0..15')
  -s a,e            (Ch0..7=All DAC Channels 0..7, Ch8..15=External ADC
                    Input)
  -s e,g           (Ch0..7=External ADC input, Ch8..15=ground calibration)
  -s +/e           (Ch0..7=Postive calibration, Ch8..15=External ADC input)
  -s -            (Ch0..15=Negative calibration)
  -s t            (Ch0..15=2.5 volt calibration)
  -s e/f          (Ch0..7=External ADC input, Ch8..15=5 volt calibration)
  -s e/12         (Ch0..7=External ADC input, Ch8..15=DAC Channel 12)
-v DacVoltage        (DAC Voltage. -10.0 to +20.0)
  -v 1.5,9.9      (Ch0..3=1.5 volts, Ch4..15= 9.9 volts)
  -v 2.5/7.5,12.7 (Ch0..3=2.5 volts, 4..7=7.5 volts, 8..15=12.7 volts)
  -v 9.95         (Ch0..15=9.95 volts)
-V OutputRange       (Output Voltage range. u10, u20, b5, b10, b20)
  'u10' - Unipolar 10 volts ( +0 --> +10 )
  single_ended/differential
  'u20' - Unipolar 20 volts ( +0 --> +20 )
  single_ended/differential

### 3.2.8 lib/ccurpmfc\_dac\_calibrate

This test is useful for performing, saving and restoring DAC calibration. If calibration '-A' is specified along with voltage '-V', the board voltage range will first be programmed prior to initiating calibration.

```
Usage: ./ccurpmfc_dac_calibrate [-A] [-b board] [-c ChanMask] [-f DataFormat]
                                     [-i inCalFile] [-o outCalFile] [-R]
                                     [-V MaxBoardVolts]

-A          (perform Auto Calibration)
-b <board>  (board #, default = 0)
-c <ChanMask> (channel selection mask, default = all channels)
-f DataFormat (select DAC data format, '2' or 'b')
  -f b,2      (Ch0..3=Offset binary, Ch4..15=Two's complement)
  -f 2/b,2    (Ch0..3 & Ch8..15=Two's complement, Ch4..7=Offset binary)
  -f b        (Ch0..15=Offset binary)
-i <In Cal File> (input calibration file [input->board_reg])
-o <Out Cal File> (output calibration file [board_reg->output])
-R          (reset DAC calibration)
-V MaxBoardVolts (Voltage range)
  -V u10,b10   (Ch0..3=UniPolar 10V, Ch4..15=BiPolar 10V)
  -Vb5/b10,u20 (Ch0..3=BiPolar 5V, 4..7=BiPolar 10V, 8..15=UniPolar 20V)
  -V b10       (Ch0..15=BiPolar 10V)
```

```
e.g. ./ccurpmfc_dac_calibrate          (Dump calibration information to
                                         stdout)
     ./ccurpmfc_dac_calibrate -A -o Calfile (Perform Auto calibration and dump
                                         information to 'Calfile')
     ./ccurpmfc_dac_calibrate -i Calfile   (Update board calibration with
                                         supplied 'Calfile')
     ./ccurpmfc_dac_calibrate -R          (Reset DAC calibration)
```

#### Example display:

```
./ccurpmfc_dac_calibrate -A -oOutputCal
```

```
Device Name      : /dev/ccurpmfc0
Board Serial No: 674459 (0x000a4a9b)
Auto Calibration started...done. (2.572 seconds)
```

==> Board calibration data written to 'OutputCal' file

### 3.2.9 lib/ccurpmfc\_dac\_setchan

This test generates voltages on various Analog Output channels.

```
Usage: ./ccurpmfc_dac_setchan [-b board] [-c ChannelSelectMask]
      [-C DacUpdateClock] [-D DMAEngine][-f format] [-i]
      [-l LoopCnt] [-m WriteMode] [-N] [-o OutputSelect]
      [-S NumSamples] [-u UpdateMode] [-v OutputVolts]
      [-V OutputRange] [-w WaveType]

-A          (Perform DAC Auto Calibration first using reference
            voltage)
-b <board>  (board #, default = 0)
-c <ChannelSelectMask> (channel selection mask, default = all channels)
-C DacUpdateClock (select DAC update clock, 0..6 or 's|S')
  -C s      (Ch0..15=Software Update)
  -C 6@20000.0 (Ch0..15=Clock6 at 20000 SPS)
  -C 4      (Ch0..15=Clock4 at MAX SPS)
-D DMA Engine (DMA Engine number -- default = 0)
-f DataFormat (select DAC data format, '2' or 'b')
  -f b,2    (Ch0..3=Offset binary, Ch4..15=Two's complement)
  -f 2/b,2  (Ch0..3 & Ch8..15=Two's complement, Ch4..7=Offset
            binary)
  -f b      (Ch0..15=Offset binary)
-i          (Enable Interrupts -- default = Disable)
-l LoopCnt  (Loop count -- default is 0)
-m <WriteMode> (Write Mode)
  -mdp      (Driver: (Channel Registers) PIO mode)
  -mlc      (Library: (Channel Registers) program I/O Fast Memory
            Copy)
  -mld      (Library: (Channel Registers) DMA mode)
  -mlp      (Library: (Channel Registers) PIO mode)
  -mup      (User: (Channel Registers) PIO mode)
  -mdP      (Driver: (FIFO) PIO mode)
  -m1D      (Library: (FIFO) DMA mode)
  -m1P      (Library: (FIFO) PIO mode)
-N          (Open device with O_NONBLOCK flag for driver operations)
-o OutputSelect (DAC output select, 's' or 'd')
  -o d,s    (Ch0..3=differential, Ch4..15=single_ended)
  -o s/d,s  (Ch0..3 & Ch8..15=single_ended, Ch4..7=differential)
  -o d      (Ch0..15=differential)
-S <NumSamples> (Number of Samples per channel, default = 512)
-u          (Set DAC Update Mode)
  -ui      (Set DAC Update Mode to Immediate Mode)
  -us      (Set DAC Update Mode to Synchronized Mode)
-v DacVoltage (DAC Voltage. -10.0 to +20.0)
  -v 1.5,9.9 (Ch0..3=1.5 volts, Ch4..15= 9.9 volts)
  -v 2.5/7.5,12.7 (Ch0..3=2.5 volts, 4..7=7.5 volts, 8..15=12.7 volts)
  -v 9.95    (Ch0..15=9.95 volts)
-V OutputRange (Output Voltage range. u10, u20, b5, b10, b20)
  'u10' - Unipolar 10 volts ( +0 --> +10 )
         single_ended/differential
  'u20' - Unipolar 20 volts ( +0 --> +20 )
         single_ended/differential
  'b5'  - Bipolar 5 volts ( -5 --> +5 )
         single_ended
  'b10' - Bipolar 10 volts ( -10 --> +10 )
         single_ended/differential
  'b20' - Bipolar 20 volts ( -20 --> +20 )
         differential
```

```

-V u10,b10          (Ch0..3=UniPolar 10V, Ch4..15=BiPolar 10V)
-Vb5/b10,u20       (Ch0..3=BiPolar 5V, 4..7=BiPolar 10V, 8..15=UniPolar
                    20V)
-V b10              (Ch0..15=BiPolar 10V)
-V b20              (Ch0..15=BiPolar 20V - differential)
-w <WaveType>       (default = 'c' Constant Voltage)
-wc                 (Constant Voltage)
-wu                 (Saw Wave (up))
-wd                 (Saw Wave (down))
-ws                 (Sine Wave)
-wx                 (Square Wave)
-wy                 (Step Wave (down))
-wz                 (Step Wave (up))
-wt                 (Triangle Wave)
-ww                 (All Wave (Sine/Square/StepUp/Triangle/StepDown))

```

```

e.g. ./ccurpmfc_dac_setchan -od,s,d,s -v20,10,5,1 -wx -mdP -Vb20 (dac0&2
                                                                    differential, dac1&3 single_ended)
     ./ccurpmfc_dac_setchan -ws -ui -od                            (sine wave,
                                                                    immediate)

```

Example display:

```
./ccurpmfc_dac_setchan -ws -ui -od
```

```

### 3.2.10 lib/ccurpmfc\_dio

This test generates, views and tests various digital channels.

```
Usage: ./ccurpmfc_dio [-b BoardNo] [-d Delay] [-F DebugFile] [-l LoopCnt]
                    [-m DIOMode] [-n NumChans] [-p PatternSelect]
                    [-r RunOption] [-s SkipChannelsMask]

-b BoardNo          (Board number -- default is 0)
-d Delay            (Delay between screen refresh -- default is 100)
-F DebugFile        (Debug file -- default "=== None ===")
-l LoopCnt          (Loop count -- default is 0)
-m DIOMode          (DIO mode -- default is 1)
  -m0               (DIO Custom mode)
  -m1               (DIO Normal mode)
-n NumChans         (number of channels -- default is 96)
-p PatternSelect    (DIO mode -- default is to sequence through all
                    patterns)
  -p0               (Rolling Ones)
  -p1               (Rolling Zeros)
  -p2               (Adding Bit)
  -p3               (Toggling 'A' & '5')
-p@XXXXXXXX         (Fixed Pattern XXXXXXXX selection in Hex)
-r RunOption        (Run option -- default is 0)
  -rd               (Digital Isolators Test)
  -rD               (Fast [no curses] Digital Isolators Test)
  -ri               (Read DIO input channels)
  -rl               (Internal Loopback DIO test)
  -rL               (Fast [no curses] internal loopback DIO test)
  -re               (External Loopback DIO test)
  -rE               (Fast [no curses] external loopback DIO test)
  -ro               (Write pattern to DIO output channels)
-s SkipChannelsMask (Skip channels mask -- default is 0@0x00000000
                    1@0x00000000 2@0x00000000)
  -s0@XXXXXXXX      (Channels 31..00=XXXXXXXX in Hex)
  -s1@XXXXXXXX      (Channels 63..32=XXXXXXXX in Hex)
  -s2@XXXXXXXX      (Channels 95..64=XXXXXXXX in Hex)
e.g. ./ccurpmfc_dio -rl -s1@ffffffff (Internal Loopback Testing. Skip Channels
                                     32-63)
     ./ccurpmfc_dio -rE -s2@ffffffff (External Loopback w/o Curses Testing. Skip
                                     Channels 64-95)
```

#### Example display:

```
./ccurpmfc_dio -rl -s1@FFFFFFFF
```

In this example we are performing an internal loopback test. In this case, none of the DIO channels should be connected to any external lines, otherwise, the test will fail.

=== Test Passed ===

### 3.2.11 lib/ccurpmfc\_dio\_intr

This test is used to validate the DIO change-of-state interrupt detection.

```

Usage: ./ccurpmfc_dio_intr [-b Board] [-d Delay] [-F FallCh] [-l LoopCnt]
      [-L LevelCh] [-R RiseCh] [-X DeleteCh]
-b <board>          (board #, default = 0)
-d Delay            (Delay between screen refresh -- default is 0
                  milli-seconds)
-F FallCh           (Falling Edge Channel_List)

```

```

-l LoopCnt          (Loop count -- default is 0)
-L LevelCh         (Level State Channel_List)
-R RiseCh          (Rising Edge Channel_List)
-X DeleteCh        (Delete COS Channel_List)

```

```

Examples of Channel_List. Unchanged channels default to Level State Channels:
-F -              (set all DIO channels to falling edge)
-R 1,2,7,9       (set channels 1,2,7,9 to rising edge, rest are level state)
-X 5,7-12        (delete channels 5, and 7 to 12. rest are level state)

```

Example display:

In the example below, a signal generator is connected to digital input channels 0, 1, 32 and 64. A 15 KHz, +5/0 volts square wave is injected into the selected channels. The test is run using shielding and directing to CPU 4 and 5 and driver interrupt directed to CPU 2. The reason the display shows approximately 30 KHz rate is because the test defaults to performing level detection, i.e. detecting both rising and falling edge on all channels. Depending on other activities in the system, it is possible to see some Overflow conditions.

In order to run at such high rates without getting overflow or missing user callbacks requires proper shielding and real time running of the test. Additionally, the driver interrupt handler needs to be directed to a dedicated processor in order to minimize overflows. E.g.

```

# === as root ===
# shield -a 2, 4-5          (shield processors 2, 4 and 5)
# cat /proc/ccurpmfc       (get board irq – in this case it is 'irq=56')
# echo 4 > /proc/irq/56/smp_affinity (direct board irq to be handled by processor 2)
# (if irq '56' is not present in the proc/irq directory, then you will need to start the test at least once to get it
  assigned by the kernel)
# run -b4-5 ./ccurpmfc_dio_intr

```

```

0001303506 - COS Interrupt Duration (usec):      34.89 min=22.65 max=44.09
run_ave=33.24 (30081.28 Hz)
Driver Interrupt Response Time (usec):          17.96 min=15.79 max=27.27

```

Destroying User COS Interrupt Handler

```
./ccurpmfc_dio_intr -F0,32 -R64
```

In this example, we are detecting the falling edge for channels 0 and 32, rising edge for channel 64 and level detection for the rest of the channels. This is why you will see the count for channel 1 (level detection) double that of channels 0, 32 and 64.

```

### 3.2.12 lib/ccurpmfc\_disp

Useful program to display the local board registers. This program uses the *curses* library. This test is similar to the previous non-library test.

```

Usage: ./ccurpmfc_disp [-b Board] [-d Delay] [-D DMAEngineNo] [-H] [-i]
        [-l LoopCnt] [-m XferMode] [-o Offset] [-P Pause]
        [-s XferSize] [-S DispSize]
-b Board      (Board number -- default board is 0)
-d Delay      (Delay between screen refresh -- default is 0)
-D DMAEngineNo (DMA Engine number -- default = 1)
-H            (Enable Hyper-Drive Mode -- default "=== Disabled ===")
-i            (Enable Interrupts -- default = Disable)
-l LoopCnt    (Loop Count - default = 0)
-m XferMode   (Transfer Mode -- default = DMA)
  -md         (Avalon Memory: DMA mode)
  -mm         (Avalon Memory: Modular Scatter-Gather DMA mode)
  -mp         (Avalon Memory: Programmed I/O mode)
  -mS        (SDRAM Memory: DMA mode)
  -ms        (SDRAM Memory: Programmed I/O mode)
-o Offset     (Hex offset to read from -- default is 0x0)
-P Pause      (Microseconds to sleep in User Function loop -- default is 0)
-s XferSize   (Number of bytes to transfer -- default is 0x1000)
-S DispSize   (Number of bytes to display -- default is 0x200)

```

Example display:

```
./ccurpmfc_disp
```

### 3.2.13 lib/ccurpmfc\_dma

This test transfers data from physical memory to the Local register area and back. There are three modes of operation. One is regular DMA, the second is Modular Scatter-Gather DMA and the third is programmed I/O. Depending on the number of DMA engines supported by the card, the user can select one of them to perform the DMA. Additionally, if the card supports Modular Scatter-Gather DMA, then they can also select that. Area select is one of three areas the user can specify. They represent the area in physical memory and local register where the transfer is to occur. The test automatically switches to a different area corresponding to the regular DMA engine supplied. If multiple copies of this application is run on the same card using the same DMA engine, then the user needs to manually select a different area '-A' so the data mismatch does not occur due to using the same area region.

Usage: ./ccurpmfc\_dma [-A Area2Select] [-b Board] [-D DMAEngineNo] [-i]  
[-l LoopCnt] [-m XferMode] [-s Size] [-v VerboseNo]  
-A Area2Select (Area to select -- default = -1)

```

-b Board      (Board number -- default = 0)
-D DMAEngineNo (DMA Engine number -- default = 0)
-i           (Enable Interrupts -- default = Disable)
-l LoopCnt    (Loop Count - default = 1000)
-m XferMode   (Transfer Mode -- default = DMA)
  -md        (DMA mode)
  -mm        (MsgDma mode - '-D' option is ignored)
  -mp        (Programmed I/O mode)
-s Size       (Transfer Size in bytes (multiple of byte width) -
              default = 12288)
-V VerboseNo  (verbose -- default = 0)

e.g. ./ccurpmfc_dma -A1 (perform dma using DMA0 on area 1 )
     ./ccurpmfc_dma -i -D1 (perform dma using DMA1 with interrupts on area 0)
     ./ccurpmfc_dma -mm (perform dma using MsgDMA on area 0)

```

Example display:

```
./ccurpmfc_dma
```

```

  PhysMemSizeFreed=0x00000000
  EntryInTxTbl =1
  NumOfEntriesUsed=1
  Flags       =0x0000
### Configuring ADC ###
- Activate ADC (disable followed by enable)
- Configure ADC
- Set Calibration to Positive Reference Voltage
- Calibrate ADC
### Configuring DAC ###
- Activate DAC (disable followed by enable)
- Select Software Update
- Configure DAC
- Write 0 to DAC outputs
- Make DAC operational
- Calibrate DAC
### Programming Clocks ###
### Reading ADC Channels ###

### Single (one descriptor) Modular Scatter-Gather DMA ###
- Allocating memory and seeding with pattern
- Seizing MSGDMA
- Configure Single MSGDMA (PCIe ==> Avalon)
- Fire Single MSGDMA: Xfer 0x8000 bytes: Pcie ==> Avalon (@0x8000)
- Validating data
- Configure Single MSGDMA (Avalon ==> PCIe)
- Fire Single MSGDMA: Xfer 0x8000 bytes: Avalon (@0x8000) ==> PCIe
- Validating data
- Releasing MSGDMA

### Multi (four descriptor) Modular Scatter-Gather DMA (Single-Shot) ###
- Allocating memory and seeding with pattern)
- Seizing MSGDMA
- Configure multi MSGDMA (PCIe ==> Avalon ==> PCIe ==> Avalon ==> PCIe)
- Setup Multi MSGDMA
- Fire Multi MSGDMA (Single-Shot)
- Validating data
- Releasing MSGDMA

```

```

### Multi (four descriptor) Modular Scatter-Gather DMA (Clone) ###
- Allocating memory and seeding with pattern)
- Seizing MSGDMA
- Configure multi MSGDMA (PCIe ==> Avalon ==> PCIe ==> Avalon ==> PCIe)
- Setup Multi MSGDMA
- Stop and Initialize Multi MSGDMA (Clone)
- Fire Multi MSGDMA and wait one cycle (Clone: Once cycle wait)
- Validating data
- Releasing MSGDMA

```

### 3.2.15 lib/ccurpmfc\_expires

This test is useful in displaying board expires information.

```

Usage: ./ccurpmfc_expires -[b Board] -[s]
      -b <board>           (board #, default = 0)
      -s                   (short display, default = verbose)

```

#### Example display:

*./ccurpmfc\_expires (for card that has no restrictions)*

```

Device Name: /dev/ccurpmfc0
Board Serial No: 98765 (0x000181cd)

```

```

#####
###                               ###
###      UNRESTRICTED FIRMWARE    ###
###                               ###
#####

```

*./ccurpmfc\_expires (for restricted card that has NO expiration date)*

```

Device Name: /dev/ccurpmfc0
Board Serial No: 98765 (0x000181cd)

```

```

#####
###                               ###
###      RESTRICTED FIRMWARE      ###
###                               ###
#####

```

```

=====
=== No Expiration Date ===
=====

```

*./ccurpmfc\_expires (for restricted card that has expiration date)*

```

Device Name: /dev/ccurpmfc0
Board Serial No: 98765 (0x000181cd)

```

```

#####
###                               ###
###      RESTRICTED FIRMWARE      ###
###                               ###
#####

```

```

=====
Local Expiration Date: 03/11/2018 13:21:52
GMT Expiration Date: 03/11/2018 17:21:52
Duration to Expire: Days=122, Hours=2, Minutes=49, Seconds=20

```

```

=====
./ccurpmfc_expires -s (for card that has no restrictions)

Unrestricted

./ccurpmfc_expires -s (for restricted card that has NO expiration date)

Restricted: No expiration date

./ccurpmfc_expires -s (for restricted card that has expiration date)

Restricted: Expire in 10550462 seconds

```

### 3.2.16 lib/ccurpmfc\_identify

This test is useful in identifying a particular card by displaying its LED.

```

Usage: ./ccurpmfc_identify -[absx]
    -a                (Identify all cards through a light sequence)
    -b <board>        (board #, default = 0)
    -s <seconds>      (Identify Board: ENABLED for number of seconds,
                      default = 10)
    -s 0              (Identify Board: DISABLED)
    -s <negative value> (Identify Board: ENABLED forever)
    -x                (silent)

```

If the '-a' option is selected, all other options are ignored. This option will sequence through all the cards found in turn as follows:

- 1) The first device number will flash its LED for 10 seconds
- 2) The remaining devices numbers will be selected sequentially and flash their LEDs for 3 seconds

#### Example display:

```

./ccurpmfc_identify

Device Name      : /dev/ccurpmfc0
Board ID         : 9290
Board Type       : 02
Board Function   : 01
Board Serial No  : 674459 (0x000a4a9b)
Firmware Revision : 4.0 (Major.Minor)
MsgDma Support   : 0 descriptors (No)

Identify ENABLED on board 0 (LED should start flashing for 10 seconds)
Sleeping for 10 seconds...
Identify DISABLED on board 0 (LED should stop flashing)

./ccurpmfc_identify -a

TotalBoardCount=5

```

### 3.2.18 lib/ccurpmfc\_msgdma

This test performs a modular scatter-gather DMA test on boards that support it. Additionally, it displays performance information for each mode of operation.

```

Usage: ./ccurpmfc_msgdma [-a AddrOff,ToAddrOff] [-b Board] [-d NumDesc]
      [-f Input,Output] [-i] [-l LoopCnt] [-m Mode]
      [-s TotalXferSize] [-v] [-X]
-a <AddrOff,ToAddrOff> (First Avalon Address Offset, default DiagRam offset)
                        (Second 'ToAddrOff' only for Avalon2Avalon mode
                        (board #, default = 0)
-b <Board>
-d <NumDesc>
  (Number of Descriptors, default = 1)
-f <Input>,<#Output>
  (Use input file as input data. default None)
  (Use Output file to write 'to' data. default None)
  (Prepend with '#' to remove comments and address)
-i
  (Use interrupts, default is poll)
-l <LoopCnt>
  (Loop Count, default = 1000)
-m <Mode>
  (Mode of Operation, default = all)
  'a2p'
    (Avalon memory address to Pci memory address)
  'p2a'
    (Pci memory address to Avalon memory address)
  'p2p'
    (Pci memory address to Pci memory address)
  'a2a'
    (Avalon memory address to Avalon memory address)
  'all'
    (All above modes with only memory addresses)

  'A2p'
    (Avalon FIFO address to Pci memory address - specify
    FIFO address '-a')
  'p2A'
    (Pci memory address to Avalon FIFO address - specify
    FIFO address '-a')
  'A2A'
    (Avalon FIFO address to Avalon FIFO address - specify
    FIFO address '-a')
-s <TotalXferSize>
  (Total Transfer Size in bytes, default size of
  DiagRam)
  (Maximum transfer size is 0x3FFFF)
-v
  (Verbose operation. default is quiet)

```

-X

(Skip Data Validation, default is to validate)

Notes:

- 1) For modes 'p2a' or 'a2p' only the first address 'AddrOff' is used in option '-a'
- 2) For modes 'a2a' the first address 'AddrOff' is "FROM" and second address 'ToAddrOff' is "TO"
- 3) If Input file is specified in the '-f' option, its contents is used to seed input
- 4) If '-X' option is specified, no pattern is written to input, unless '-f Input' option is specified
- 5) Multiple '-m' options can be specified on a single command line
- 6) When address '-a' option is not specified, DiagRam offset is used for Analog input/output
- 7) Normal running process if no arguments specified is as follows:
  - a) Incrementing pattern written to the input using programmed I/O and readback validated
  - b) Output written with 'baadbeef' pattern using programmed I/O
  - c) Scatter-Gather DMA performed from Input to Output
  - d) Data is read back from both Input and Output using programmed I/O and compared
- 8) An upper case 'A' in the -m option represents an Avalon FIFO address, while a lower case 'a' in the -m option represents a regular Avalon memory address
- 9) If a regular memory Avalon address is specified as an Avalon FIFO address and vice-versa results will be unpredictable
- 10) When either input or output Avalon address is pointing to a FIFO, then data validation is skipped
- 11) If a size is specified for a memory or FIFO address that is greater than it can handle, the result will be unpredictable. You will need to reset the firmware to restore proper operation

e.g. ./ccurpmfc\_msgdma -mall (Run all transfer modes with validation)  
./ccurpmfc\_msgdma -a0x8000 -s0x100 (Run all modes with Avalon Address 0x8000 and size 0x100)  
./ccurpmfc\_msgdma -a0xA000 -s0x200 -ma2a (Run a2a with Avalon Address 0xA000 and size 0x200)  
./ccurpmfc\_msgdma -mp2a -l1 -d1 -fHexFile\_16K -a0x10004 -X (Transfer Input file to Avalon memory at 0x10004)  
./ccurpmfc\_msgdma -ma2p -l1 -d1 -f,OutFile -s0x4000 -a0x10004 -X (Transfer Avalon memory at 0x10004 to output file 'OutFile')  
./ccurpmfc\_msgdma -mA2p -l10000 -s0x20000 -d16 -a0x18010 (Transfer Avalon FIFO at 0x18010 to PCI memory with 16 Descriptors where each descriptor has a transfer size of 0x2000 bytes. No validation will be performed)

Example display:

./ccurpmfc\_msgdma

```
### TotalXferSize = 0x00008000, individual descriptor length=0x008000 ###

```

### 3.2.19 lib/ccurpmfc\_msgdma\_clone

Cloning is an optional feature of this card that can be purchased separately. The basic cloning option is an extremely powerful tool that gives the user the ability to continuously transfer the contents of a region on the card to a physical memory entirely under hardware control, once cloning has commenced. This continuous transfer is performed at MsgDma speeds. A more advanced cloning option that can be purchased is known as Region Addressing. This option allows the board to Clone any MsgDma location to another MsgDma location, i.e. the source and destination locations can be any valid MsgDma able physical address in the system.

Only one Cloning or MsgDma operation can be active at a given time. Additionally, it is meaningless to perform Cloning on a FIFO region for two reasons. Firstly, each data in a FIFO is synchronous, however, the Cloned region is accessed asynchronously. Secondly, when the FIFO runs empty (*underflow*) or cannot accept more data (*overflow*) the results are unpredictable.

***Caution:*** *Since physical addresses are supplied to this test, care must be taken to ensure that the supplied addresses are valid and that while cloning is in progress, the memory regions must not be freed or made inactive, otherwise, the results could be unpredictable and could lead to the possible corruption of the system.*

This test show the capabilities of this new cloning option.

```

Usage: ./ccurpmfc_msgdma_clone [-a FromAddr,ToAddr] [-b Board] [-d Delay]
      [-F DebugFile] [-l LoopCnt] [-P] [-q] [-s XferSize]
      [-S DisplaySize] [-v Delay] [-X] [-Z]
-a <FromAddr,ToAddr> (Clone address space From/To address in Hex)
                    (If address less than board size, board offset used)
-b <Board>          (board #, default = 0)
-d <Delay>          (Delay between screen refresh -- default is 0
                    milli-seconds)
-F DebugFile        (Debug file -- default "=== None ===")
  @DebugFile        (Debug file and no display)
  @                  (No Debug file and no display)
-l LoopCnt          (Loop count -- default is 0)
-P                  (Program Board)
-q                  (Quite (non-interactive) mode)
-s <XferSize>       (Transfer size bytes)
-S <DisplaySize>    (Display size bytes)
-v Delay            (Verify data. Add additional one cycle delay in
                    micro-seconds if specified)
-X                  (Disable region protection)
-Z                  (Disable address cache - default is enabled)

```

```

e.g.
./ccurpmfc_msgdma_clone (Clone DiagRam to physical memory
                          created by this program)
./ccurpmfc_msgdma_clone -a,-1 (Clone DiagRam to physical memory
                              created by this program)
./ccurpmfc_msgdma_clone -a-1,-1 -v (Clone physical memory to physical
                                    memory created by this program
                                    and verify)
./ccurpmfc_msgdma_clone -a,c000 -s0x1000 -v (Clone DiagRam at 0x8000 to board
                                             DiagRam at 0xc000)
./ccurpmfc_msgdma_clone -a8000,c000 -s0x4000 -v (Clone DiagRam at 0x8000 to
                                                  DiagRam at 0xc000 and verify)
./ccurpmfc_msgdma_clone -a8000,-1 -s0x4000 -v (Clone DiagRam at 0x8000 to
                                                physical memory created and
                                                verify)
./ccurpmfc_msgdma_clone -a-1,8000 -s0x4000 -v (Clone physical memory created to
                                                DiagRam at 0x8000 and verify)
./ccurpmfc_msgdma_clone -a,0xbd308000 -X (Clone DiagRam to some other board
                                           at specified physical address)

```

### 3.2.20 lib/ccurpmfc\_msgdma\_info

This test provides useful modular scatter-gather DMA information for cards that support it.

```
Usage: ./ccurpmfc_msgdma_info [-b Board] [-l]
      -b <Board>          (board #, default = 0)
      -l                  (long format)
```

#### Example display:

```
./ccurpmfc_msgdma_info
```

```

### 3.2.21 lib/ccurpmfc\_msgdma\_multi\_clone

This test is a more powerful version of the *ccurpmfc\_msgdma\_clone* test above. It allows the users to specify multiple source and destination addresses during the cloning operation. There is a limit on the number of physical memory that can be created or mapped. When that limit is reached, the tests fail to run. Additionally, there is a limit to the number of MsgDmadesccriptors that can be specified. Once again, if that limit is exceed the test will fail to run.

**Caution:** *Since physical addresses are supplied to this test, care must be taken to ensure that the supplied addresses are valid and that while cloning is in progress, the memory regions must not be freed or made inactive, otherwise, the results could be unpredictable and could lead to the possible corruption of the system.*

```

Usage: ./ccurpmfc_msgdma_multi_clone [-a FromAddr,ToAddr,Size] [-b Board] [-d Delay]
      [-F DebugFile] [-l LoopCnt] [-P] [-q] [-s XferSize]
      [-S DisplaySize] [-t|T FromAddr,Size] [-X] [-Z]
-a <FromAddr,ToAddr,Size> (Clone address space From/To address (hex) and
                          size (bytes))
                          (If address less than board size, board offset used)
-b <Board>                (board #, default = 0)
-d <Delay>                (Delay between screen refresh -- default is
                          5 milli-seconds)
-F DebugFile              (Debug file -- default "=== None ===")
  @DebugFile              (Debug file and no display)
  @                        (No Debug file and no display)
-l LoopCnt                (Loop count -- default is 0)
-P                        (Program Board)
-q                        (Quite (non-interactive) mode)
-s <XferSize>             (Transfer size in bytes)
-S <DisplaySize>          (Display size in bytes)
-t <FromAddr,Size>        (Perform debug firmware testing - From address (hex)
                          and size (bytes) - non-verbose)
-T <FromAddr,Size>        (Perform debug firmware testing - From address (hex)
                          and size (bytes) - verbose)
-X                        (Disable region protection)
-Z                        (Disable address cache - default is enabled)

```

Note: If the size is not specified in the '-a' option, then the default size or that specified in the '-s' option is used  
 If debug firmware is installed, you can use the '-t|T' option  
 The debug firmware uses Clock 3 and its value is programmed by the 't|T' option

e.g.  
 ./ccurpmfc\_msgdma\_multi\_clone (Clone DiagRam to physical memory)

```

./ccurpmfc_msgdma_multi_clone -a,-1          created by this program)
                                              (Clone DiagRam to physical memory
                                              created by this program)
./ccurpmfc_msgdma_multi_clone -a-1,-1        (Clone physical memory to physical
                                              memory created by this program)
./ccurpmfc_msgdma_multi_clone -a,c000 -s0x1000 (Clone DiagRam at 0x8000 to board
                                              DiagRam at 0xc000)
./ccurpmfc_msgdma_multi_clone -a8000,c000 -s0x4000 (Clone DiagRam at 0x8000 to DiagRam
                                              at 0xc000)
./ccurpmfc_msgdma_multi_clone -a,0xbd308000 -X (Clone DiagRam to some other board
                                              at specified physical address)
./ccurpmfc_msgdma_multi_clone -a8000,8800 -a8800,9000 -a9000,9800 -a9800,a000
-a000,a800 -aa800,b000 -ab000,b800 -ab800,c000
-ac000,c800 -s256
                                              (Clone through all 9 descriptors)
./ccurpmfc_msgdma_multi_clone -a8000,8800 -a8800,9000 -a9000,9800 -a9800,a000,128
-aa000,a800 -aa800,b000 -ab000,b800 -ab800,c000
-ac000,c800,288 -s256 -S288
                                              (Clone through all 9 descriptors
                                              with different sizes)
./ccurpmfc_msgdma_multi_clone -t              (Perform non-verbose Debug Firmware
                                              testing using default address
                                              0x6000 and size 256 (64 samples))
./ccurpmfc_msgdma_multi_clone -T,256 -F/tmp/LOG (Perform verbose Debug Firmware
                                              testing using default address, 256
                                              bytes and send output to /tmp/LOG)

```

Example display:

```
./ccurpmfc_msgdma_multi_clone
```

```

### 3.2.22 lib/ccurpmfc\_smp\_affinity

This test provides a useful mechanism to display or set the IRQ to specific set of CPUs. This is useful when we want to make sure that the driver interrupts are not being interfered with other CPU activity.

```

Usage: ./ccurpmfc_smp_affinity [-b Board] [-c CpuMask]
      -b Board      (Board number -- default is 0)
      -c CpuMask    (CPU mask in HEX -- default is none)

```

```

e.g. ./ccurpmfc_smp_affinity      (display IRQ CPU mask for selected board)
      ./ccurpmfc_smp_affinity -c2  (set IRQ CPU for cpu 1)
      ./ccurpmfc_smp_affinity -c4  (set IRQ CPU for cpu 2)
      ./ccurpmfc_smp_affinity -c0x8 (set IRQ CPU for cpu 3)
      ./ccurpmfc_smp_affinity -cE2 (set IRQ CPU for cpu 1,5,6,7)

```

#### Example display:

```

./ccurpmfc_smp_affinity
(IRQ57) fc user f8 actual

```

```

./ccurpmfc_smp_affinity -b1 -c8
(IRQ57) 08 user 08 actual

```

### 3.2.23 lib/ccurpmfc\_transfer

This test performs various DMA and Programmed I/O transfers between the board components and the PCI memory.

```

Usage: ./ccurpmfc_transfer [-b Board] [-c CaseNum] [-i] [-l LoopCnt]
      [-s XferSize]
      -b Board      (Board number -- default is 0)
      -c CaseNum    (Select Case Numbers -- default = ALL CASES)
      -c 4,1,7-9   select case 1,4,7,8,9)
      -c 8-        select case 8 to end)
      -c -3        select case 1,2,3)
      -i            (Enable Interrupts -- default = Disable)
      -l LoopCnt    (Loop Count -- default is 100)
      -s XferSize   (Avalon Ram Xfer Size in bytes -- default is 32768)

```

Example display:

./ccurpmfc\_transfer (for cards with modular scatter-gather DMA support)

```

**** Test Passed ****

```

### 3.2.24 lib/ccurpmfc\_tst\_lib

This is an interactive test that accesses the various supported API calls.

```

Usage: ./ccurpmfc_tst_lib [-b board]
      -b board: board number -- default board is 0

```

#### Example display:

```
./ccurpmfc_tst_lib
```

```
Device Name: /dev/ccurpmfc0
```

### 3.2.25 lib/IpCore/ccurpmfc\_ipcore\_cos

This program demonstrates the features of the IP Core Change of State card.

```

Usage: ./ccurpmfc_ipcore_cos [-b Board] [-c ChannelMask] [-d Delay]
                                [-D DMAEngineNo] [-F DebugFile] [-l LoopCnt]
                                [-m XferMode] [-n Element2Display] [-T TestNumber]
                                [-V VerifyPattern] [-w Control] [-x]

-b Board          (Board number -- default board is 0)
-c ChannelsMask   (select channels mask)
  -c0@XXXXXXXX    (Channels 31..00=XXXXXXXX in Hex)
  -c1@XXXXXXXX    (Channels 63..32=XXXXXXXX in Hex)
-d Delay          (Delay in milli-secs between screen refresh -- default is 0)
-D DMAEngineNo   (DMA Engine number -- default = 1)
-F DebugFile     (Debug file with menu display -- default "=== None ===")
  @DebugFile     (Debug file without display)
  @              (No debug file and no display)
-l LoopCnt       (Loop Count - default = 0)
-m XferMode      (Transfer Mode -- default = DMA)
  -md            (Library ccurPMFC_Transfer_Data(): DMA mode)
  -mp            (Library ccurPMFC_Transfer_Data(): Progammed I/O mode)
-n Element2Display (Number of Elements to Display -- default is 128)
-T TestNumber    (Execute Self test 0=alternate or 1=increment pattern)
  -T0           (Atlernate pattern test -- AAAAAAAA/55555555)
  -T1           (Increment pattern test)
-V VerifyPattern (Verify capture rate, increment or alternate test pattern)
  -Vr           (compute capture rate)
  -Vp           (verify increment or alternate test pattern (-winc or -walt))
-w Control       (select control: Normal/Test(increment/alternate pattern,
  div=1,2,4,8,16,32,64,128), Start/Stop
  -wte -wsta    (select 'test; mode and 'start' capture)
  -wn -wStop    (select 'normal' mode and 'stop' capture)
  -walt -wttest (select 'alternation - 5555/AAAA' and 'test' mode capture)
  -winc -wttest (select 'increment - 5555/AAAA' and 'test' mode capture)

```

```

-winc -w128 -wtest
        (select 'increment - 5555/AAAA' and 'test' mode capture with
time divider of 128)
-x          (Skip decoding of timestamp)

e.g. ./ccurpmfc_ipcore_cos -c0@ffff -c1@ffff0000 -wtest -wstart (select channels
        00..15 and 63..48, test mode, start capture)
./ccurpmfc_ipcore_cos -c0@ffffffff -c1@ffffffff -wtest -walt -wstart -Vp
        (verify alternate 5555/AAAA pattern)
./ccurpmfc_ipcore_cos -T0 (verify alternate 5555/AAAA pattern)
./ccurpmfc_ipcore_cos -T1 (verify increment pattern test)

```

```

### 3.2.26 lib/Sprom/ccurpmfc\_sprom

This is a simple program to demonstrate sprom access.

```

Usage: ./ccurpmfc_sprom [-b board] [-C] [-D] [-S serialNo]
-b <board>          (Board #, default = 0)

```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```
-C          (Clear ENTIRE serial PROM first)
-D          (Dump entire serial prom)
-S <serialNo> (Program board serial number)

e.g. ./ccurpmfc_sprom -C          -> Clear Entire Serial Prom First
     ./ccurpmfc_sprom -D          -> Dump Entire Serial Prom
     ./ccurpmfc_sprom -S 12345678 -> Write Serial Number
```

Example display:

```
./Sprom/ccurpmfc_sprom
```

```
Device Name:      /dev/ccurpmfc0
Board Serial Number: 12345 (0x00003039)
Serial PROM Revision: 0 (0x0000)
```
